

How to write a scientific paper

Scott Bloomer and Michael J. Haas

You have spent the last six months wrestling with a difficult scientific challenge and feel that it's finally time to let the world know what you have found out; it's time to write the paper. How can all that work be distilled into a few pages that will clearly set forth how the work was done, what was found, and why it is important? Scientific writing for peer-reviewed journals can be as challenging as the research itself.

The whole point of the writing is to help people understand the wonderful discoveries you have made—a void in the vast network of human knowledge and the answers that fill that void. The best way to accomplish your goal is to write clearly and convincingly so the author “disappears” and the readers are led to the conclusion that they themselves are very smart because they understand this profound new discovery. To achieve this, you need to go through the painful process of distancing yourself from your own work and approaching the field from the perspective of the intelligent but uninformed reader—a very difficult thing to do. Thoughts must be organized, choices must be made, and hours of writing lie before you.

Peer-reviewed journals

The research community does not establish research findings as fact until they have been peer-reviewed and published. The object of peer review is to ensure that the findings are novel, sound, and appropriate for a given journal. Experts in the field who demonstrate their qualifications as peer reviewers by the caliber of their own work carry out peer reviewing on a volunteer basis.

The function of peer reviewing is to help authors bring their manuscripts to a clear, crisp, and engaging account of important scientific research that easily allows the reader to learn about the scientific advancements in the manuscript. Hopefully, the manuscript will inspire others to new insights and will serve as a building block for further scientific advances.

Peer reviewers usually receive no more reward for their work than the satisfaction that comes from advancing the frontiers of scientific knowledge. However, the reward of helping an author transform the manuscript as submitted into a paper that is ready for publishing is often enough!

General principles of scientific writing

Simplify, simplify, simplify. Never use ten words if five will do. Remember, much of your readership consists of very smart people for whom English is their second, third, or fourth language. You want them to understand and appreciate your work, not your vocabulary or flowery sentence construction. Simple is elegant.

After you write your first draft, let the document sit for a few days so that you get some distance from it. Then, go over it with a strict eye to condensing the wording, replacing long phrases with short efficient ones, and breaking run-on sentences into multiple short ones. Pretend you will be charged for each word; this will help you remove excess verbiage.

Rather than generalized phrases (“Renewable fuels are good for the environment”) use words that convey information (“Relative to fossil-based diesel fuel, biodiesel offers the environmental advantages of reduced particulate, carbon monoxide, and sulfur emissions”).

Get a feel for the style of the journal to which your manuscript will be submitted by reading two or three recently published articles. There are definite differences between journals in such things as the degree of detail in the materials and methods, the length and historical span of the introduction, the size of a discussion, and the presence, form and size of a conclusion section.

Get off the launch pad

The great inertial barrier that you feel when contemplating the authorship of a paper—that feeling of being unable to sit down and begin writing polished paragraphs—is not a feeling unique to you alone. Many authors struggle with this.

One way to overcome this situation is to abandon the idea that perfect paragraphs must flow onto the paper from the start. Some authors find it best to begin by just getting their thoughts down on paper; they find that full sentences and then paragraphs can be readily built from these. For others, a good strategy is to start composing an outline of the paper; the full-sentence version then follows.

Writing the paper

An excellent place to start a manuscript is with the materials and methods section. You will need to write it anyway, and it often involves the least imaginative and complicated of the writing to be done. Starting here also serves as a valuable aid in focusing on the paper, and can help build up the momentum that allows you to tackle other sections. The motto “well begun is half done” is very true in this situation.

The materials and methods section must be written clearly and be sufficiently complete that other scientists, even those not familiar with your specialty, could repeat the work. Assembling a simple collection of procedural outlines makes a good starting point; this can then be turned into prose. Remember, you are reciting what you did, so use past tense. Provide references; use references that outline a method, avoid those that simply refer to another paper that does.

Ask others not familiar with the procedures to read through this section. It can be surprisingly easy to overlook an obvious fact

**Simplify,
simplify,
simplify.**
