Low Dimensional Semiconductors Materials Physics Technology Devices Series On Semiconductor Science And Technology:

Low-dimensional Semiconductors M. J. Kelly, 1995-11-23 This text is a first attempt to pull together the whole of semiconductor science and technology since 1970 in so far as semiconductor multilayers are concerned. Material technology, physics and device issues are described with approximately equal emphasis and form a single coherent point of view. The subject matter is the concern of over half of today's active semiconductor scientists and technologists, the remainder working on bulk semiconductors and devices. It is now routine to design and prepare semiconductor multilayers at a time with independent control over the doping and composition in each layer. In turn, these multilayers can be patterned with features that are as small as a few atomic layers in lateral extent. The resulting structures open up many new areas of exciting solid state and quantum physics. They have also led to whole new generations of electronic and optoelectronic devices whose superior performance relates back to the multilayer structures. The principles established in the field have several decades to go, advancing towards the ultimate of materials engineering: the design and preparation of solids atom by atom. The book should appeal equally to physicists, electronic engineers and materials scientists.

Low-dimensional Semiconductors Michael J. Kelly, 1995 It is now routine to design and prepare semiconductor multilayers, one atomic layer at a time, with independent control over the doping and composition, approaching atomic scale resolution in each layer. In turn, these multilayers can be patterned with features that are as small as only a few atomic layers in lateral extent. These resulting structures not only have led to new generations of electronic and optoelectronic devices offering superior performance but also have opened up many new areas of exciting solid state and quantum physics. This book collates the whole of semiconductor science and technology relating to semiconductor multilayers since 1970 and points the way towards the ultimate of materials engineering: the design and preparation of solids atom by atom. Materials technology, physics and device issues are covered in detail, making this work ideal for physicists, electronic engineers and materials scientists alike.

Einstein's Photoemission Kamakhya Prasad Ghatak, 2014-11-19. This monograph solely investigates the Einstein's Photoemission (EP) from Heavily Doped (HD) Quantized Structures on the basis of newly formulated electron dispersion laws. The materials considered are quantized structures of HD non-linear optical III-V II-VI Ge-Te, Platinum Antimonide, stressed materials GaP, Gallium Antimonide, II-V Bismuth Telluride, together with various types of HD superlattices and their quantized counterparts, respectively. The EP in HD optoelectronic materials and their nanostructures is studied in the presence of strong light waves and intense electric fields that control the studies of such quantum effect devices. The suggestions for the experimental determinations of different important physical quantities in HD 2D and 3D materials and the importance of measurement of band gap in HD optoelectronic materials under intense built-in electric field in nano devices and strong external photo excitation for measuring physical properties in the presence of intense light waves which alter the electron energy spectra have also been discussed in this context. The influence of quantizing magnetic field on the EP of the different HD quantized structures, quantum wells, quantum well HD superlattices, and nipi structures under different physical conditions has been investigated. This monograph contains 100 open research problems which form the integral part of the text and are useful for both Ph.D. aspirants and researchers in the fields of materials science, condensed matter physics, solid state sciences, nano science and technology, and allied fields. In addition to the graduate courses in modern semiconductor nanostructures offered in different Universities and Institutes.
