Groups Of Homotopy Classes Rank Formulas And Homotopy Commutativity:

Groups of Homotopy Classes M. Arkowitz, C. R. Curjel, 2006-12-08 Many of the sets that one encounters in homotopy classification problems have a natural group structure Among these are the groups A_{nX} of homotopy classes of maps of a space A into a loop space ΩX Other examples are furnished by the groups $\pi_n(Y)$ of homotopy classes of homotopy equivalences of a space Y with itself The groups A_{nX} and $\pi_n(Y)$ are not necessarily abelian It is our purpose to study these groups using a numerical invariant which can be defined for any group This invariant called the rank of a group is a generalisation of the rank of a finitely generated abelian group It tells whether or not the groups considered are finite and serves to distinguish two infinite groups We express the rank of subgroups of A_{nX} and of $\pi_n(Y)$ in terms of rational homology and homotopy invariants The formulas which we obtain enable us to compute the rank in a large number of concrete cases As the main application we establish several results on commutativity and homotopy commutativity of H spaces Chapter 2 is purely algebraic We recall the definition of the rank of a group and establish some of its properties These facts which may be found in the literature are needed in later sections Chapter 3 deals with the groups A_{nX} and the homomorphisms $f: B \rightarrow A_{nX}$ induced by maps $f: A \rightarrow B$ We prove a general theorem on the rank of the intersection of coincidence subgroups Theorem 3.3

Groups of homotopy classes Martin Arkowitz, Caspar R. Curjel, 1967 **Commutative Group Schemes** F.

Oort, 2006-11-14 We restrict ourselves to two aspects of the field of group schemes in which the results are fairly complete commutative algebraic group schemes over an algebraically closed field of characteristic different from zero and a duality theory concerning abelian schemes over a locally noetherian prescheme The preliminaries for these considerations are brought together in chapter I SERRE described properties of the category of commutative quasi algebraic groups by

introducing pro algebraic groups In char 0 the situation is clear In characteristic different from zero information on finite group schemes is needed in order to handle group schemes this information can be found in work of GABRIEL In the second chapter these ideas of SERRE and GABRIEL are put together Also extension groups of elementary group schemes are determined A suggestion in a paper by MANIN gave crystallization to a feeling of symmetry concerning subgroups of abelian varieties In the third chapter we prove that the dual of an abelian scheme and the linear dual of a finite subgroup scheme are related in a very natural way Afterwards we became aware that a special case of this theorem was already known by CARTIER and BARSOTTI Applications of this duality theorem are the classical duality theorem duality hypothesis proved by CARTIER and by NISHI calculation of $\text{Ext}^i(A, A)$ where A is an abelian variety result conjectured by SERRE a proof of the symmetry condition due to MANIN concerning the isogeny type of a formal group attached to an abelian variety
