diseases and nutritional environmental and hematologic disorders Each chapter focuses on the neurologic aspects related to a specific disease presentation **Public Health** Jay Maddock,2012-05-30 Public health can be thought of as a series of complex systems Many things that individual living in high income countries take for granted like the control of infectious disease clean potable water low infant mortality rates require a high functioning systems comprised of numerous actors locations and interactions to work Many people only notice public health when that system fails This book explores several systems in public health including aspects of the food system health care system and emerging issues including waste minimization in nanosilver Several chapters address global health concerns including non communicable disease prevention poverty and health longevity medicine The book also presents several novel methodologies for better modeling and assessment of essential public health issues **Toxins and Hemostasis** R. Manjunatha Kini,Kenneth J Clemetson,Francis S. Markland,Mary Ann McLane,Takashi Morita,2010-10-19 Circulation of blood is vital for the survival of vertebrates including man Mainly it plays an important role in carrying food nutrients and oxygen to every tissue and organ and in removing all waste products and carbon dioxide Any imbalance in the hemostatic and cardiovascular systems can lead to death and severe debility A number of animals have developed mechanisms to target these systems and exploit the vulnerability In some species for example snakes such mechanisms are used to immobilize and kill the victim prey whereas in others for example insects such as leaches mosquitoes and ticks they are used to provide a continuous supply of blood These mechanisms include but are not limited to procoagulant and anticoagulant actions that affect the coagulation cascade and platelet aggregation as well as altering vasodilatory responses In all these various animals these mechanisms have evolved to perfection over millions of years to support their survival In last 3 4 decades due to the efforts of scientists from various backgrounds including biology protein chemistry molecular biology pharmacology hematology and structural biology significant progress in understanding the structure function relationships as well as the mechanism of action have been made in a number of exogenous factors that affect blood coagulation platelet aggregation and vasodilation from various animals These exogenous factors have contributed significantly to the development of research tools as well as providing new therapeutic agents With the increase average age of the population coupled with changes in life style in recent years there has been a significant increase in cardiovascular and hematological disorders Thus scientists in both academic institutions as well as the pharmaceutical industry are developing better therapeutic agents to improve the quality of life This impetus has lead to the search for novel agents from various sources that interfere with cardiovascular and hematalogical processes Although at first glance exogenous factors appear to function as villains several life saving drugs have been developed based upon these factors Such drugs or drug leads include those that inhibit the angiotensin converting enzymes Captopril and Enalapril that block platelet receptors Eptifibatide and Tirofiban or that digest thrombotic plugs Alfimeprase and bat plasminogen activator to name a few Several new and exciting success stories are currently unfolding In this book recent

studies on some of the exogenous factors that play crucial roles in cardiovascular and hematological disorders are reviewed in order to consolidate the efforts in this area of research and to recruit new talented researchers The 25 30 review chapters each written by experts in their field compiled herein are devoted to exogenous factors affecting platelet aggregation anticoagulant and procoagulant proteins fibrinolytic proteins and hypotensive agents For details see Contents of the Book This book is intended to help to create elevated awareness and enthusiasm in the field of exogenous factors I believe that this book will provide greater impetus to the search for novel proteins based on naturally occurring exogenous factors This will be the first book dealing extensively with exogenous factors in the last 25 years The book will provide a ready reference to the different approaches used to solve complex problems in protein chemistry and pharmacology of exogenous factors The book will update our understanding of the structure function relationships and mechanisms of action of exogenous factors and provide great insights into future directions for solving the remaining challenges

Identification and Functional Characterization of Novel Venom Components Steven D. Aird, 2020-12-29 Throughout most of the 20th century the toxinological literature consisted largely of pharmacological and functional characterizations of crude venoms and venom constituents often constituents that could not be identified unambiguously The advent of amino acid composition analysis in the 1950s enabled the first forays into physical characterizations of purified toxins though these remained few in number until the 1970s Then the tryptic and chymotryptic cleavage of venom proteins coupled with manual Edman degradation began to provide the first complete sequences particularly of three finger toxins Polyacrylamide gel electrophoresis and improved resins for liquid chromatography

permitted improved purification and better gross structural characterization of venom components The early 1980s witnessed the advent of automated Edman degradation and entire sequences of longer proteins began to be reported in the literature Then the molecular biology revolution enabled the generation of cDNA sequences of more and larger proteins followed by mass spectrometry based proteomics and quantitative high throughput DNA sequencing and genomics Today we face an unprecedented situation in which our capacity to generate sequence structural data has completely overwhelmed our capacity to functionally characterize venom constituents This Special Issue of Toxins includes 11 publications addressing the discovery and functional characterization of novel venom constituents of vertebrate and invertebrate venoms **Snake**

Venom Metalloproteinases Jay Fox, José María Gutiérrez, 2018-07-10 This book is a printed edition of the Special Issue Snake Venom Metalloproteinases that was published in Toxins **Diversity and Evolution of Animal Venoms:**

Neglected Targets, Ecological Interactions, Future Perspectives Sebastien Dutertre, Maria Vittoria Modica, Mande Holford, Kartik Sunagar, 2020-05-06 **Analysis of Peptides and Proteins by Electrophoretic Techniques** Angela R.

Piergiovanni, José Manuel Herrero-Martínez, 2019-07-23 The characterization of peptides and proteins is central to understanding their function and expression in biological matrices Moreover these macromolecules are important biomarkers of many human diseases In recent years the performance of separation techniques based on electromigration have significantly increased The development of microdevices has reduced sample consumption and waste production while high sensitivity detectors such as mass spectrometry MS or laser induced fluorescence LIF have significantly improved with regards to separation efficiency and detection limits All of these advancements have led to appreciably enlarged fields of application Nowadays a multitude of studies using separation techniques based on electromigration to study proteins and peptides from numerous real matrices are available in the literature This Special Issue covers the most recent knowledge and advances in the study of peptides and proteins using several electrophoresis techniques as well as the characterization of relevant proteins and peptides in application areas such as clinical studies functional foods and toxicology
