Abstract: The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the body composition and muscle strength of 10 sedentary, middle-aged men. The men were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program, while the CON group remained sedentary. The RT group showed significant increases in muscle strength and body composition, while the CON group showed no significant changes. The results suggest that a 12-week, 100% BW resistance training program can improve muscle strength and body composition in sedentary, middle-aged men.
