HAMMER TYPE

Multi-Impact Spring Hammer

Jaques Hammer mills are built especially to reduce limestone and other relatively non-plastic materials to "fines" (20-100 mesh). Based on the unique, spring-type hammer, feeding of these single components at the point of impact and rotating at high speed, several pieces of the material are crushed simultaneously. Low resistance powered spring hammer plates in the hammer and free space that the hammer action of pulverizing is carried out on the material before it reaches the screening grids, thereby increasing wear on the hammers and grids.

These compact, sturdy hammers and hammer bearing housings are made in six sizes ranging 12" to 36" diameter in the vertical position in two operation. High percentage of fine mesh sizes are produced — discharge ports for screening are set to suit applications. They can be installed either vertically or horizontally. The available integrated bearing surfaces are easily accessible.

GYRATORY TYPES

Gyrax — Size 14"

Light Weight but Sturdy
High Efficiency
Low Feed Rate

Traylor 'TY' and 'TZ'

For 2000 to 100,000 lb. per hour

Fine Reduction — Excellent Product
High Speed — Large Capacity
Low Overall Operating Costs

The Gyrax Fine Reduction Crusher is a lightweight crusher combining proven strength with an unusually high efficiency.

The Traylor design of ball feed and spread screens feed to these crushers allowing feeding and grinding between crushing faces.

The construction is uncomplicated and easy to maintain after bearings, and the screens, drive shaft and gears are all mounted in oil-air bath of circulating pump cooled for a long life of service.

These crushers are suitable for feeding at extremely low settings, and by reason of their light weight, low feed rates and low power consumption are particularly adaptable for use with small portable crushing plants and specialized for crushing applications in process industries.

Can be equipped with either bar or conical driving pulley.

These crushers are manufactured under license to the Traylor Eng. & Mfg. Company of Jefferson, Mo., U.S.A. Type 'TY' and 'TZ' crushers are compact machines crushing into fine mesh and feed rates from 2000 to 100,000 lbs. per hour. They are designed for high efficiency and low maintenance in operation. The drive is of cast heavy, self-aligning, ball feed and spread screens at all angles before discharge without discharge and a self-aligning mechanism internally feed into roller bearings.

The same capacity and efficiency of Traylor Gyration Crushers is due to the advanced design of the ball feed and spread screens.

Crushing is achieved by increasing the capacity of each crushing feeding zone — power requirements are reduced, even at flow settings for producing a grade just below the screen, instead of a close crushing flow. The reduced clearance between material and crushing surfaces greatly increases the life of these parts. Ideal for secondary and tertiary crushing operations.

ROLL TYPE

Double Crushing Roll

Construction and 10" diameter

Crushing rolls will handle a wide range of materials, including those which cannot be crushed successfully by other machines.

The product from crushing rolls is generally intermediate in size between that of the reduction crusher and grinding mills.

The spacing capacity of rolls being broken, they should be formed of steel structure to gradually rise the larger material in the feed.

These rolls will take five times of crushing rolls for comminuting capacity of same capacity. They are usually set for an even feed of material to the rolls.

Rolls should be set in a way to compress feed, crush and roll it. They may be set to crush, crush, feed, compress or roll, according to the service required.

Roller buffers or springs are fitted to provide the necessary crushing pressure and protect the movable roll in case of should undesirable substances enter the machine.

PLATE APRON TYPE

PAN TYPE

10" to 36" wide — 10' to 100' long — 10' to 100' capacity

These feeders are manufactured with frames in the Jaques Eng. & Mfg. Company of Jefferson, Mo., U.S.A. and are designed for service, capacity, construction and the impact of large lumps of material directed directly on to the feeder. They are most satisfactory when used with an impact crusher, a solid surface and are used for or in service, any feeder material. The pans are fitted together with heavy pins and are supported by large steel rollers running in slots. Heavy duty, ball-bearing bearings, mounted in right form of heavy steel frame, support the pans.

Other common good construction with anti-friction bearings, control, or suitable speed reduction control units can be the feeder.
