Lectures Functor Homology Progress Mathematics:

Lectures on Functor Homology Vincent Franjou,Antoine Touzé,2015-12-08 This book features a series of lectures that explores three different fields in which functor homology short for homological algebra in functor categories has recently played a significant role For each of these applications the functor viewpoint provides both essential insights and new methods for tackling difficult mathematical problems In the lectures by Aur lien Djament polynomial functors appear as coefficients in the homology of infinite families of classical groups e g general linear groups or symplectic groups and their stabilization Djament s theorem states that this stable homology can be computed using only the homology with trivial coefficients and the manageable functor homology The series includes an intriguing development of Scorichenko s unpublished results The lectures by Wilberd van der Kallen lead to the solution of the general cohomological finite generation problem extending Hilbert s fourteenth problem and its solution to the context of cohomology The focus here is on the cohomology of algebraic groups or rational cohomology and the coefficients are Friedlander and Suslin s strict polynomial functors a conceptual form of modules over the Schur algebra Roman Mikhailov s lectures highlight topological invariants homoto py and homology of topological spaces through derived functors of polynomial functors In this regard the functor framework makes better use of naturality allowing it to reach calculations that remain beyond the grasp of classical algebraic topology Lastly Antoine Touz s introductory course on homological algebra makes the book accessible to graduate students new to the field The links between functor homology and the three fields mentioned above offer compelling arguments for pushing the development of the functor viewpoint The lectures in this book will provide readers with a feel for functors and a valuable new perspective to apply to their favourite problems **Lectures On Algebraic Topology** Haynes R Miller,2021-09-20 Algebraic Topology and basic homotopy theory form a fundamental building block for much of modern mathematics These lecture notes represent a culmination of many years of leading a two semester course in this subject at MIT The style is engaging and student friendly but precise Every lecture is accompanied by exercises It begins slowly in order to gather up students with a variety of backgrounds but gains pace as the course progresses and by the end the student has a command of all the basic techniques of classical homotopy theory An Introduction to Intersection Homology Theory, Second Edition Frances Kirwan,Jonathan Woolf,2006-06-07 Now more that a quarter of a century old intersection homology theory has proven to be a powerful tool in the study of the topology of singular spaces with deep links to many other areas of mathematics including combinatorics differential equations group representations and number theory Like its predecessor An Introduction to Intersection Homology Theory Second Edition introduces the power and beauty of intersection homology explaining the main ideas and omitting or merely sketching the difficult proofs It treats both the basics of the subject and a wide range of applications providing lucid overviews of highly technical areas that make the subject accessible and prepare readers for more advanced work in the area This second edition contains entirely new chapters

introducing the theory of Witt spaces perverse sheaves and the combinatorial intersection cohomology of fans Intersection homology is a large and growing subject that touches on many aspects of topology geometry and algebra With its clear explanations of the main ideas this book builds the confidence needed to tackle more specialist technical texts and provides a framework within which to place them **Recent Progress in Homotopy Theory** Donald M. Davis,2002 This volume presents the proceedings from the month long program held at Johns Hopkins University Baltimore MD on homotopy theory sponsored by the Japan U S Mathematics Institute JAMI The book begins with historical accounts on the work of Professors Peter Landweber and Stewart Priddy Central among the other topics are the following 1 classical and nonclassical theory of H spaces compact groups and finite groups 2 classical and chromatic homotopy theory andlocalization 3 classical and topological Hochschild cohomology 4 elliptic cohomology and its relation to Moonshine and topological modular forms and 5 motivic cohomology and Chow rings This volume surveys the current state of research in these areas and offers an overview of futuredirections **Handbook of Algebra** M. Hazewinkel,2006-05-30 Algebra as we know it today consists of many different ideas concepts and results A reasonable estimate of the number of these different items would be somewhere between 50 000 and 200 000 Many of these have been named and many more could and perhaps should have a name or a convenient designation Even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information If this happens one should be able to find enough information in this Handbook to judge if it is worthwhile to pursue the quest In addition to the primary information given in the Handbook there are references to relevant articles books or lecture notes to help the reader An excellent index has been included which is extensive and not limited to definitions theorems etc The Handbook of Algebra will publish articles as they are received and thus the reader will find in this third volume articles from twelve different sections The advantages of this scheme are two fold accepted articles will be published quickly and the outline of the Handbook can be allowed to evolve as the various volumes are published A particularly important function of the Handbook is to provide professional mathematicians working in an area other than their own with sufficient information on the topic in question if and when it is needed Thorough and practical source for information Provides in depth coverage of new topics in algebra Includes references to relevant articles books and lecture notes *The Local Structure of Algebraic K-Theory* Bjørn Ian Dundas,Thomas G. Goodwillie,Randy McCarthy,2012-09-06 Algebraic K theory encodes important invariants for several mathematical disciplines spanning from geometric topology and functional analysis to number theory and algebraic geometry As is commonly encountered this powerful mathematical object is very hard to calculate Apart from Quillen s calculations of finite fields and Suslin s calculation of algebraically closed fields few complete calculations were available before the discovery of homological invariants offered by motivic cohomology and topological cyclic homology This book covers the connection between algebraic K theory and B kstedt Hsiang and Madsen s topological cyclic homology and proves that the

difference between the theories are locally constant The usefulness of this theorem stems from being more accessible for calculations than K theory and hence a single calculation of K theory can be used with homological calculations to obtain a host of nearby calculations in K theory For instance Quillen s calculation of the K theory of finite fields gives rise to Hesselholt and Madsen s calculations for local fields and Voevodsky s calculations for the integers give insight into the diffeomorphisms of manifolds In addition to the proof of the full integral version of the local correspondence between K theory and topological cyclic homology the book provides an introduction to the necessary background in algebraic K theory and highly structured homotopy theory collecting all necessary tools into one common framework It relies on simplicial techniques and contains an appendix summarizing the methods widely used in the field The book is intended for graduate students and scientists interested in algebraic K theory and presupposes a basic knowledge of algebraic topology

Deformation Theory of Algebras and Their Diagrams Martin Markl,2012 This book brings together both the classical and current aspects of deformation theory The presentation is mostly self contained assuming only basic knowledge of commutative algebra homological algebra and category theory In the interest of readability some technically complicated proofs have been omitted when a suitable reference was available The relation between the uniform continuity of algebraic maps and topologized tensor products is explained in detail however as this subject does not seem to be commonly known and the literature is scarce The exposition begins by recalling Gerstenhaber s classical theory for associative algebras The focus then shifts to a homotopy invariant setup of Maurer Cartan moduli spaces As an application Kontsevich s approach to deformation quantization of Poisson manifolds is reviewed Then after a brief introduction to operads a strongly homotopy Lie algebra governing deformations of diagrams of algebras of a given type is described followed by examples and generalizations   Threading Homology Through Algebra G. Boffi,David Buchsbaum,2006-06-29 Aimed at graduate students and researchers in mathematics this book takes homological themes such as Koszul complexes and their generalizations and shows how these can be used to clarify certain problems in selected parts of algebra as well as their success in solving a number of them   *Quantum Field Theory and Noncommutative Geometry* Ursula Carow-Watamura,Yoshiaki Maeda,2005-02-21 This volume reflects the growing collaboration between mathematicians and theoretical physicists to treat the foundations of quantum field theory using the mathematical tools of q deformed algebras and noncommutative differential geometry A particular challenge is posed by gravity which probably necessitates extension of these methods to geometries with minimum length and therefore quantization of space This volume builds on the lectures and talks that have been given at a recent meeting on Quantum Field Theory and Noncommutative Geometry A considerable effort has been invested in making the contributions accessible to a wider community of readers so this volume will not only benefit researchers in the field but also postgraduate students and scientists from related areas wishing to become better acquainted with this field   **Global Differential Geometry** Christian Bär,Joachim Lohkamp,Matthias Schwarz,2011-12-18 This volume

contains a collection of well written surveys provided by experts in Global Differential Geometry to give an overview over recent developments in Riemannian Geometry Geometric Analysis and Symplectic Geometry The papers are written for graduate students and researchers with a general interest in geometry who want to get acquainted with the current trends in these central fields of modern mathematics **Progress in Commutative Algebra 1** Christopher Francisco,Lee C. Klingler,Sean Sather-Wagstaff,Janet C. Vassilev,2012-04-26 This is the first of two volumes of a state of the art survey article collection which originates from three commutative algebra sessions at the 2009 Fall Southeastern American Mathematical Society Meeting at Florida Atlantic University The articles reach into diverse areas of commutative algebra and build a bridge between Noetherian and non Noetherian commutative algebra These volumes present current trends in two of the most active areas of commutative algebra non noetherian rings factorization ideal theory integrality and noetherian rings the local theory graded situation and interactions with combinatorics and geometry This volume contains combinatorial and homological surveys The combinatorial papers document some of the increasing focus in commutative algebra recently on the interaction between algebra and combinatorics Specifically one can use combinatorial techniques to investigate resolutions and other algebraic structures as with the papers of Fl ystad on Boij S derburg theory of Geramita Harbourne and Migliore and of Cooper on Hilbert functions of Clark on minimal poset resolutions and of Mermin on simplicial resolutions One can also utilize algebraic invariants to understand combinatorial structures like graphs hypergraphs and simplicial complexes such as in the paper of Morey and Villarreal on edge ideals Homological techniques have become indispensable tools for the study of noetherian rings These ideas have yielded amazing levels of interaction with other fields like algebraic topology via differential graded techniques as well as the foundations of homological algebra analysis via the study of D modules and combinatorics as described in the previous paragraph The homological articles the editors have included in this volume relate mostly to how homological techniques help us better understand rings and singularities both noetherian and non noetherian such as in the papers by Roberts Yao Hummel and Leuschke *Categorification in Geometry, Topology, and Physics* Anna Beliakova,Aaron D. Lauda,2017-02-21 The emergent mathematical philosophy of categorification is reshaping our view of modern mathematics by uncovering a hidden layer of structure in mathematics revealing richer and more robust structures capable of describing more complex phenomena Categorification is a powerful tool for relating various branches of mathematics and exploiting the commonalities between fields It provides a language emphasizing essential features and allowing precise relationships between vastly different fields This volume focuses on the role categorification plays in geometry topology and physics These articles illustrate many important trends for the field including geometric representation theory homotopical methods in link homology interactions between higher representation theory and gauge theory and double affine Hecke algebra approaches to link homology The companion volume Contemporary Mathematics Volume 683 is devoted to categorification and higher representation theory **Operads And Universal Algebra -**

Proceedings Of The International Conference Chengming Bai,Li Guo,Jean-louis Loday,2012-02-23 The book aims to exemplify the recent developments in operad theory in universal algebra and related topics in algebraic topology and theoretical physics The conference has established a better connection between mathematicians working on operads mainly the French team and mathematicians working in universal algebra primarily the Chinese team and to exchange problems methods and techniques from these two subject areas   **An Alpine Anthology of Homotopy Theory** Dominique Arlettaz,Kathryn Hess,2006 The second Arolla conference on algebraic topology brought together specialists covering a wide range of homotopy theory and K theory These proceedings reflect both the variety of talks given at the conference and the diversity of promising research directions in homotopy theory The articles contained in this volume include significant contributions to classical unstable homotopy theory model category theory equivariant homotopy theory and the homotopy theory of fusionsystems as well as to K theory of both local fields and C algebras   *Lusternik-Schnirelmann Category* Octavian Cornea,2003 Lusternik Schnirelmann category is like a Picasso painting Looking at category from different perspectives produces completely different impressions of category s beauty and applicability from the Introduction Lusternik Schnirelmann category is a subject with ties to both algebraic topology and dynamical systems The authors take LS category as the central theme and then develop topics in topology and dynamics around it Included are exercises and many examples The book presents the material in a rich expository style The book provides a unified approach to LS category including foundational material on homotopy theoretic aspects the Lusternik Schnirelmann theorem on critical points and more advanced topics such as Hopf invariants the construction of functions with few critical points connections with symplectic geometry the complexity of algorithms and category of 3 manifolds This is the first book to synthesize these topics It takes readers from the very basics of the subject to the state of the art Prerequisites are few two semesters of algebraic topology and perhaps differential topology It is suitable for graduate students and researchers interested   *The Unity of Mathematics* Pavel Etingof,Vladimir S. Retakh,I. M. Singer,2007-05-31 Tribute to the vision and legacy of Israel Moiseevich Gel fand Written by leading mathematicians these invited papers reflect the unity of mathematics as a whole with particular emphasis on the many connections among the fields of geometry physics and representation theory Topics include conformal field theory K theory noncommutative geometry gauge theory representations of infinite dimensional Lie algebras and various aspects of the Langlands program   *Equivariant Stable Homotopy Theory and the Kervaire Invariant Problem* Michael A. Hill,Michael J. Hopkins,Douglas C. Ravenel,2021-07-29 A complete and definitive account of the authors resolution of the Kervaire invariant problem in stable homotopy theory   **Mathematical Reviews** ,2007   Generalized Cohomology Akira Kōno,Dai Tamaki,2006 Aims to give an exposition of generalized co homology theories that can be read by a group of mathematicians who are not experts in algebraic topology This title starts with basic notions of homotopy theory and introduces the axioms of generalized co homology theory It also discusses various types of generalized cohomology

theories   Banach Spaces and their Applications in Analysis Beata Randrianantoanina,Narcisse Randrianantoanina,2011-12-22 In recent years there has been a surge of profound new developments in various aspects of analysis whose connecting thread is the use of Banach space methods Indeed many problems seemingly far from the classical geometry of Banach spaces have been solved using Banach space techniques This volume contains papers by participants of the conference Banach Spaces and their Applications in Analysis held in May 2006 at Miami University in Oxford Ohio in honor of Nigel Kalton s 60th birthday In addition to research articles contributed by participants the volume includes invited expository articles by principal speakers of the conference who are leaders in their areas These articles present overviews of new developments in each of the conference s main areas of emphasis namely nonlinear theory isomorphic theory of Banach spaces including connections with combinatorics and set theory algebraic and homological methods in Banach spaces approximation theory and algorithms in Banach spaces This volume also contains an expository article about the deep and broad mathematical work of Nigel Kalton written by his long time collaborator Gilles Godefroy Godefroy s article and in fact the entire volume illustrates the power and versatility of applications of Banach space methods and underlying connections between seemingly distant areas of analysis
