Callender Highlander, Alex Capaldi, Carrie Diaz Eaton, 2020-02-17 Speaking directly to the growing importance of research experience in undergraduate mathematics programs this volume offers suggestions for undergraduate appropriate research projects in mathematical and computational biology for students and their faculty mentors. The aim of each chapter is twofold for faculty to alleviate the challenges of identifying accessible topics and advising students through the research process for students to provide sufficient background additional references and context to excite students in these areas and to enable them to successfully undertake these problems in their research Some of the topics discussed include Oscillatory behaviors present in real world applications from seasonal outbreaks of childhood diseases to action potentials in neurons Simulating bacterial growth competition and resistance with agent based models and laboratory experiments Network structure and the dynamics of biological systems. Using neural networks to identify bird species from birdsong samples Modeling fluid flow induced by the motion of pulmonary cilia Aimed at undergraduate mathematics faculty and advanced undergraduate students this unique guide will be a valuable resource for generating fruitful research collaborations between students and faculty

Optimal Trajectory Tracking of Nonlinear Dynamical Systems Jakob Löber, 2016-12-20 By establishing an alternative foundation of control theory this thesis represents a significant advance in the theory of control systems of interest to a broad range of scientists and engineers While common control strategies for dynamical systems center on the system state as the object to be controlled the approach developed here focuses on the state trajectory. The concept of precisely realizable trajectories identifies those trajectories that can be accurately achieved by applying appropriate control signals The resulting simple expressions for the control signal lend themselves to immediate application in science and technology The approach permits the generalization of many well known results from the control theory of linear systems e.g. the Kalman rank condition to nonlinear systems The relationship between controllability optimal control and trajectory tracking are clarified Furthermore the existence of linear structures underlying nonlinear optimal control is revealed enabling the derivation of exact analytical solutions to an entire class of nonlinear optimal trajectory tracking problems The clear and self contained presentation focuses on a general and mathematically rigorous analysis of controlled dynamical systems The concepts developed are visualized with the help of particular dynamical systems motivated by physics and Nonlinear Dynamics in Physiology and Medicine Anne Beuter, Leon Glass, Michael C. Mackey, Michael S. chemistry Titcombe, 2003-09-12 Introduces concepts from nonlinear dynamics using an almost exclusively biological setting for motivation and includes examples of how these concepts are used in experimental investigations of biological and physiological systems One novel feature of the book is the inclusion of classroom tested computer exercises This book will appeal to students and researchers working in the natural and physical sciences wanting to learn about physiological systems from a mathematical perspective **Biohybrid Systems** Ranu Jung, 2012-09-19 The discipline of neurodesign is a highly interdisciplinary one while at the same time in the process of maturing towards real life applications. The breakthrough about

to be achieved is to close the loop in communication between neural systems and electronic and mechatronic systems and actually let the nervous system adapt to the feedback from the man made systems To master this loop scientists need a sound understanding of neurology from the cellular to the systems scale of man made systems and how to connect the two These scientists comprise medical scientists neurologists and physiologists engineers as well as biophysicists And they need the topics in a coherently written work with chapters building upon another **Algebraic and Symbolic Computation** Methods in Dynamical Systems Alban Quadrat, Eva Zerz, 2020-05-30 This book aims at reviewing recent progress in the direction of algebraic and symbolic computation methods for functional systems e g ODE systems differential time delay equations difference equations and integro differential equations In the nineties modern algebraic theories were introduced in mathematical systems theory and in control theory Combined with real algebraic geometry which was previously introduced in control theory the past years have seen a flourishing development of algebraic methods in control theory One of the strengths of algebraic methods lies in their close connections to computations. The use of the above mentioned algebraic theories in control theory has been an important source of motivation to develop effective versions of these theories when possible With the development of computer algebra and computer algebra systems symbolic methods for control theory have been developed over the past years The goal of this book is to propose a partial state of the art in this direction To make recent results more easily accessible to a large audience the chapters include materials which survey the main mathematical methods and results and which are illustrated with explicit examples **Progress in Differential-Algebraic Equations II** Timo Reis, Sara Grundel, Sebastian Schöps, 2020-10-10 This book contains articles presented at the 9th Workshop on Differential Algebraic Equations held in Paderborn Germany from 17 20 March 2019 The workshop brought together more than 40 mathematicians and engineers from various fields such as numerical and functional analysis control theory mechanics and electromagnetic field theory The participants focussed on the theoretical and numerical treatment of descriptor systems i e differential algebraic equations DAEs The book contains 14 contributions and is organized into four parts mathematical analysis numerics and model order reduction control as well as applications It is a useful resource for applied mathematicians with interest in recent developments in the field of differential algebraic equations but also for engineers in particular those interested in modelling of constraint mechanical systems thermal networks or electric circuits
