New Enhanced Sensitivity Infrared Laser Spectroscopy Techniques Applied to Reactive Plasmas and Trace Gas Detection Stefan Welzel, 2009 Infrared laser absorption spectroscopy IRLAS employing both tuneable diode and quantum cascade lasers TDLs

QCLs has been applied with both high sensitivity and high time resolution to plasma diagnostics and trace gas measurements. TDLAS combined with a conventional White type multiple pass cell was used to detect up to 13 constituent molecular species in low pressure Ar H₂ N₂ O₂ and Ar CH₄ N₂ O₂ microwave discharges among them the main products such as H₂O NH₃ NO and CO HCN respectively. The hydroxyl radical has been measured in the mid infrared MIR spectral range in situ in both plasmas yielding number densities of between 10¹¹–10¹² cm⁻³. Strong indications of surface dominated formation of either NH₃ or N₂O and NO were found in the H₂ N₂ O₂ system. In methane containing plasmas a transition between deposition and etching conditions and generally an incomplete oxidation of the precursor were observed. The application of QCLs for IRLAS under low pressure conditions employing the most common tuning approaches has been investigated in detail. A new method of analysing absorption features quantitatively when the rapid passage effect is present is proposed. If power saturation is negligible integrating the undisturbed half of the line profile yields accurate number densities without calibrating the system. By means of a time resolved analysis of individual chirped QCL pulses the main reasons for increased effective laser line widths could be identified. Apart from the well known frequency down chirp non linear absorption phenomena and bandwidth limitations of the detection system may significantly degrade the performance and accuracy of inter pulse spectrometers. The minimum analogue bandwidth of the entire system should normally not fall below 250 MHz. QCLAS using pulsed lasers has been used for highly time resolved measurements in reactive plasmas for the first time enabling a time resolution down to about 100 ns to be achieved. A temperature increase of typically less than 50 K has been established for pulsed DC discharges containing Ar N₂ and traces of NO. The main NO production and depletion reactions have been identified from a comparison of model calculations and time resolved measurements in plasma pulses of up to 100 ms. Considerable NO destruction is observed after 5–10 ms due to the impact of N atoms. Finally thermoelectrically cooled pulsed and continuous wave cw QCLs have been employed for high finesse cavity absorption spectroscopy in the MIR. Cavity ring down spectroscopy CRDS has been performed with pulsed QCLs and was found to be limited by the intrinsic frequency chirp of the laser suppressing an efficient intensity build up inside the cavity. Consequently the accuracy and advantage of an absolute internal absorption calibration is not achievable. A room temperature cw QCL was used in a complementary cavity enhanced absorption spectroscopy CEAS configuration which was equipped with different cavities of up to 1–3 m length. This spectrometer yielded path lengths of up to 4 km and a noise equivalent absorption down to 4 × 10⁻⁸ cm⁻¹ Hz⁻¹. The corresponding molecular concentration detection limit e.g. for CH₄ N₂O and C₂H₂ at 1303 cm⁻¹ was generally below 1 × 10⁻¹⁰ cm⁻³ for 1 s integration times and one order of magnitude less for 30 s integration times. The main limiting factor for achieving even higher sensitivity is the residual mode noise of the cavity. Employing a 0.5 m long cavity the achieved sensitivity was good enough for the selective measurement of trace atmospheric constituents at 2.2 mbar.

Fatigue of Materials at Very High Numbers of Loading Cycles Hans-Jürgen Christ, 2018-11-19 This book represents the final reports of the scientific

projects funded within the DFG SPP1466 and hence provides the reader with the possibility to familiarize with the leading edge of VHCF research. It draws a balance on the existing knowledge and its enhancement by the joint research action of the priority program. Three different material classes are dealt with: structural metallic materials, long fiber reinforced polymers, and materials used in micro electro mechanical systems. The project topics address the development of suitable experimental techniques for high frequency testing and damage monitoring, the characterization of damage mechanisms and damage evolution, the development of mechanism based models, and the transfer of the obtained knowledge and understanding into engineering regulations and applications.
