**Advanced Optics Using Aspherical Elements** Bernhard Braunecker,Hans J. Tiziani,2008 Modern optical systems rely on leading edge production technologies especially when using aspherical optical elements Due to the inherent complexity of aspheres all efforts to push the technological limits are risky Thus to minimize risk clear decisions based on a good understanding of technology are indispensable This compendium is written as an optical technology reference book for development and production engineers With contributions from worldwide experts this book aids in mitigating the risk in adopting new asphere production technologies

**Global Navigation Satellite Systems** Shuanggen Jin,2012-02-03 Global Navigation Satellite System GNSS plays a key role in high precision navigation positioning timing and scientific questions related to precise positioning This is a highly precise

continuous all weather and real time technique The book is devoted to presenting recent results and developments in GNSS theory system signal receiver method and errors sources such as multipath effects and atmospheric delays Furthermore varied GNSS applications are demonstrated and evaluated in hybrid positioning multi sensor integration height system Network Real Time Kinematic NRTK wheeled robots and status and engineering surveying This book provides a good reference for GNSS designers engineers and scientists as well as the user market *Guide to Biotechnology Products and Instruments, Guide to Scientific Instruments* ,1991 *The missing woodland resources* Marian Berihuete-Azorín,María Martín Seijo,Oriol López-Bultó,Raquel Piqué,2022-07-20 Woodlands are a key source of raw materials for many purposes since early Prehistory Wood bark resin leaves fibres fungi moss or tubers have been gathered to fulfill almost every human need That led societies to develop specific technologies to acquire manage transform elaborate use and consume these resources The materials provided by woodlands covered a wide range of necessities such as food shelter clothing or tool production but they also provided resources employed for waterproofing dying medicine and adhesives among many others All these technological processes and uses are commonly difficult to identify through the archaeological record Some materials are exclusively preserved by charring or in anaerobic conditions at very exceptional sites or leave only a very slight trace behind them e g containers Consequently they have received far less attention in archaeobotanical studies compared to other kind of plant materials consumed as food or firewood This book provides an overview of technological uses of plants from the Palaeolithic to the Post Medieval period This collection of papers presents different archaeobotanical and archaeological studies dealing with the use of a wide range of woodland resources most of them among the less visible for archaeology such as bast fibres and fungi These papers present different approaches for their study combining archaeology archaeobotany and ethnoarchaeology *Ongoing Research in Jawed Fish Immunity: Structural and Functional Studies at the Protein and Cellular Levels* Monica Imarai,Brian Dixon,2020-06-04 Knowledge of jawed fish immune systems obtained in the last 15 years has been mostly obtained through the sequencing of genomes of different fish species and from the use of high throughput techniques such as transcriptomic analysis and RNA sequencing which has allowed characterization of immune gene responses at the transcriptomic level Although these have been important tools for exploring the complexities of the immune responses of fish species the next generation of knowledge requires the use of new tools and methods capable of unveiling the diversity of immune cells and molecules in jawed fish the network of interactions and responses and the mechanisms leading to immune protection against pathogens For more than 10 years many laboratories have been engaged in developing antibodies against key molecules of jawed fish immune systems in several different species because the lack of sequence conservation of most immune genes makes it impossible to use the large panel of antibodies against mammalian molecules for recognition of fish molecules The numerous genes encoding cytokines and receptors have now been used to make recombinant proteins available allowing studies of the complex network of cytokine and receptor functions central to

fish immune responses From many laboratories new and interesting knowledge about immune cells their functions and interactions can be studied with the availability of new tools and methods have begun to provide a clear understanding fish immunity at the protein and cellular levels This Research Topic gives a comprehensive overview of the current knowledge of jawed fish immune responses with a particular emphasis on structural and functional studies at the protein and cellular levels

**Cardiovascular Mechanobiology, 2nd edition** Markus Hecker,Dirk J Duncker,2023-07-18 Biomechanical forces play a major role in organ development shape and function When exceeding the physiological range however they may become detrimental for organ structure and function This is probably best exemplified by the cardiovascular system with both the heart and blood vessels being continuously exposed to the biomechanical forces exerted by the flow of blood In the heart it is the build up of pressure inside the ventricles that allows the ejection of blood into the pulmonary and systemic circulation The luminal diameter of the small arteries in both parts of the circulation determines the resistance to flow Hence it also determines the level of blood pressure in both the pulmonary and systemic circulation and thus the afterload for both ventricles of the heart A narrowing of the small arteries e.g. due to an increase in tone therefore leads to an increase in blood pressure in the affected part of the circulation This will decrease organ perfusion but increase the afterload for the corresponding ventricle of the heart Consequently the affected ventricle must build up more pressure to maintain cardiac output However if the rise in blood pressure pulmonary or arterial hypertension persists the increase in wall tension can no longer be compensated by active constriction thereby forcing the ventricle to resort to other means to unload itself Typically this is achieved by structural alterations in its wall which becomes thicker hypertrophy and stiffer remodelling of the extracellular matrix Ultimately this maladaptive response may lead to dysfunction and eventually failure of the ventricle which would only be able to eject a significantly smaller amount of blood into circulation

The increase in wall tension has resulted in an increased stretching of the cardiomyocytes as well as non cardiomyocytes such as cardiac fibroblasts which in turn alters both their phenotype and their environment Research into the mechanobiology of the heart aims to unravel the molecular and cellular mechanisms underlying the physiological response of the heart to load to learn what goes wrong when the heart is faced with sustained pressure overload This may pave the way to therapeutically interfering with this maladaptive response and thus preventing either the initial hypertrophy or its transition into heart failure While the heart is mainly subjected to pressure hence stretch as a biomechanical force the mechanobiology of vascular cells is somewhat more complex Endothelial cells lining the luminal surface of each blood vessel are continuously subjected to the viscous drag of flowing blood referred to as fluid shear stress Fluid shear stress mainly affects the endothelial cells of the small arteries and arterioles maintaining them in a dormant phenotype If blood flow is disturbed e g at arterial bifurcations or curvatures fluid shear stress declines and may give rise to a shift in phenotype of the endothelial cells A shift from anti inflammatory to pro inflammatory in combination with the reduced flow at these sites may enable leukocyte recruitment and diapedesis which results in a pro inflammatory response in the vessel wall Endothelial cells and in particular vascular smooth muscle cells are subjected to another biomechanical force the blood pressure Volume dependent distention of the vessel wall which can be achieved through an increase in blood flow results in an increase in wall tension thereby stretching of the endothelial and smooth muscle cells Like the cardiomyocytes of the heart the vascular smooth muscle cells of the small arteries and arterioles try to normalise wall tension by active constriction which cannot be maintained for long These cells subsequently undergo hypertrophy or hyperplasia depending on the size of the blood vessel and remodel the extracellular matrix so that the vessel wall also becomes thicker and stiffer This in turn raises their resistance to flow and may contribute to the increase in blood pressure in either the pulmonary or systemic circulation Research into the mechanobiology of the blood vessels aims to unravel the molecular and cellular mechanisms underlying the physiological response of the vascular cells to pressure wall tension and flow shear stress It also aims to uncover what goes wrong e g in arteriosclerosis or hypertension and to eventually specifically interfere with these maladaptive remodelling processes The aforementioned aspects of cardiovascular mechanobiology along with many more facets of this fascinating timely and highly clinically relevant field of research are addressed by the original research and review articles within this Research Topic

**In-situ Small-Angle X-ray Scattering Investigation of Transient Nanostructure of Multi-phase Polymer Materials Under Mechanical Deformation** Ahmad Zeinolebadi, 2013-01-30 The results in this dissertation set the ground to answer a fundamental question in data driven polymer material science Why don't prepared composites show less fatigue than the pure plastics A simultaneous analysis of mechanical testing and small angle X Ray scattering from the DESY source in Hamburg has been applied to approach this question which is also central to the European research project Nanotough and the results are clearly presented in this book

The evolution of the materials structure is visualized and quantitatively analyzed from exhaustive sequences of scattering images Three different classes of polymer composites are presented as typical and illustrative examples The obtained results illustrate that the interactions of their components can cause unpredictable structural effects ultimately leading to a weakening of the material where a reinforcement was expected      Popular Photography ,1990-11      *Popular Photography* ,1993-11      GeoDirectory ,1998
