**Guide to FPGA Implementation of Arithmetic Functions** Jean-Pierre Deschamps, Gustavo D. Sutter, Enrique Cantó, 2012-04-02 This book is designed both for FPGA users interested in developing new specific components generally for reducing execution times and IP core designers interested in extending their catalog of specific components The main focus is circuit synthesis and the discussion shows for example how a given algorithm executing some complex function can be translated to a synthesizable circuit description as well as which are the best choices the designer can make to reduce the circuit cost latency or power consumption This is not a book on algorithms It is a book that shows how to translate efficiently an algorithm to a circuit using techniques such as parallelism pipeline loop unrolling and others Numerous examples of FPGA implementation are described throughout this book and the circuits are modeled in VHDL Complete and synthesizable source files are available for download

*The Emerging Domain of Cooperating Objects* Pedro José Marron, Stamatis Karnouskos, Daniel Minder, Aníbal Ollero, 2011-01-19 There are a number of different system concepts that have gained much relevance in the area of embedded systems over the past couple of years First there is the classic concept of embedded systems where the focus is on control systems for physical processes Secondly the notion of pervasive computing has evolved where the vision foresees everyday objects having some form of computation capacity and in most cases sensing and communication facilities Thirdly the notion of wireless sensor networks has arisen where small computing devices are able to sense their environment and cooperate in order to achieve a well defined goal These three types of quite diverse systems share a lot of commonalities on the one hand and on the other hand have some complementary aspects in common that make a combination of these systems into a coherent system vision promising In particular the important

notions of control heterogeneity wireless communication dynamic and ad hoc nature and cost are prevalent to various degrees in each of these systems A future system concept needs to combine the strong points of all three system concepts in at least these functional aspects It has to provide support for the control of physical processes like today s embedded systems do have as good support for device heterogeneity and spontaneity of usage as required by pervasive and ubiquitous computing approaches and has to be as cost efficient and wirelessly agile as wireless sensor networks are These new systems consist therefore of individual entities or objects that jointly strive to reach a common goal which will typically be a goal in sensing or control and are dynamically and loosely federating themselves for cooperation taking care not to overtax their available resources This book presents a roadmap to these concepts which are summarized as cooperating objects
