Mass Transport Deposits In Deepwater Settings:

Mass-transport Deposits in Deepwater Settings R. Craig Shipp, Paul Weimer, Henry W. Posamentier, 2011 Historically submarine mass failures or mass transport deposits have been a focus of increasingly intense investigation by academic institutions particularly during the last decade though they received much less attention by geoscientists in the energy industry With recent interest in expanding petroleum exploration and production into deeper water depths globally and more widespread availability of high quality data sets mass transport deposits are now recognized as a major component of most deep water settings This recognition has led to the realization that many aspects of these deposits are still unknown or poorly understood This volume contains twenty three papers that address a number of topics critical to further understanding mass transport deposits These topics include general overviews of these deposits depositional settings on the seafloor and in the near subsurface interval geohazard concerns descriptive outcrops integrated outcrop and seismic data seismic forward modeling petroleum reservoirs and case studies on several associated topics This volume will appeal to a broad cross section of geoscientists and geotechnical engineers who are interested in this rapidly expanding field The selection of papers in this volume reflects a growing trend towards a more diverse blend of disciplines and topics covered in the study of mass transport deposits

New Perspectives on Deep-water Sandstones G. Shanmugam, 2012-03-14 This handbook is vital for understanding the origin of deep water sandstones emphasizing sandy mass transport deposits SMTDs and bottom current reworked sands BCRSs in petroleum reservoirs This cutting edge perspective a pragmatic alternative to the conventional turbidite concepts is crucial because the turbidite paradigm is built on a dubious foundation without empirical data on sandy turbidity currents in modern oceans In the absence of evidence for sandy turbidity currents in natural environments elegant theoretical models and experimental observations of turbidity currents are irrelevant substitutes for explaining the origin of sandy deposits as turbidites In documenting modern and ancient SMTDs sandy slides sandy slumps and sandy debrites and BCRSs deposits of thermohaline contour currents wind driven currents and tidal currents the author describes and interprets core and outcrop 1 20 to 1 50 scale from 35 case studies worldwide which include 32 petroleum reservoirs totaling more than 10 000 m in cumulative thickness carried out during the past 36 years 1974 2010 The book dispels myths about the importance of sea level lowstand and provides much needed clarity on the triggering of sediment failures by earthquakes meteorite impacts tsunamis and cyclones with implications for the distribution of deep water sandstone petroleum reservoirs Promotes pragmatic interpretation of deep water sands using alternative possibilities Validates the economic importance of SMTDs and BCRS in deep water exploration and production Rich in empirical data and timely new perspectives

Submarine Mass Movements and Their Consequences D.C. Mosher, Craig Shipp, Lorena Moscardelli, Jason Chaytor, Chris Baxter, Homa Lee, Roger Urgeles, 2009-10-27 Recent global events such as the devastating 1998 Papua New Guinea tsunami the 2004

Sumatran tsunami and the 2006 SE Asia undersea network cable failure underscore the societal and economic effects of submarine mass movements. These events call upon the scientific community to understand submarine mass movement processes and consequences to assist in hazard assessment mitigation and planning. Additionally, submarine mass movements are beginning to be recognized as prevalent in continental margin geologic sections. As such, they represent a significant if not dominant role in margin sedimentary processes. They also represent a potential hazard to hydrocarbon exploration and development but also represent exploration indicators and targets. This volume consists of a collection of the latest scientific research by international experts in geological geophysical engineering and environment aspects of submarine mass failures focussed on understanding the full spectrum of challenges presented by submarine mass movements and their consequences.

Multiscale Modeling of Deep-water Channel Deposits Lisa Elizabeth Stright, 2011. Sedimentological models capture the processes and subsequent deposits that explain the distribution of facies within a depositional system. The first sedimentological models for deep water depositional systems were portrayed as idealized shelf break to slope submarine basin sediment dispersal systems. These models were developed from ancient outcrop exposures Mutti and Lucchi 1972 and from the modern day seafloor Normark 1970 1978. More recent model development has been based largely on observations from modern slope channels including the Amazon Channel Pirmez and Imran 2003 offshore West Africa Abreu et al 2003 Deptuck et al 2003 and attempts at generalization from multiple studies Mayall et al 2006 as well as ancient outcrop studies e.g. Brushy Canyon Gardner et al 2003. Concepts from these sedimentological models have been the principle foundation for development of quantitative geostatistical models. A geostatistical model adapts the conceptualization of facies distribution from the sedimentological model. This information is then coded into a three dimensional gridded computer model directly constrained to available data i.e. wireline logs, core data and seismic attributes. Geostatistical models developed for deep water depositional systems have primarily focused on either sinuous channels confined by levees or erosional surfaces e.g. Larue and Hovadik 2006 Labourdette et al 2007 Pyrcz et al 2008 McHargue et al 2010 Sylvester et al 2010 or basin floor or overbank lobes associated with loss of confinement from sinuous channels Pyrcz et al 2005 Wellner et al 2006 Zhang et al 2009. Although widely used, such geostatistical models have limited applicability in fitting all deep water depositional systems and cases exist that require modification of such models or creation of entirely new models. In this dissertation, I show the importance of synthesizing sedimentological and geostatistical models based on observations from the data. The primary objectives of this dissertation are 1) to present methodologies to enable the creation of better sedimentological models from remote sensing data and 2) to present a means to model depositional architectures for a system that cannot currently be captured with standard geostatistical modeling approaches. The main contributions are threefold. The first contribution presented in Chapter 1 is a methodology designed to extract subseismic lithologic information from inverted pre-stack seismic reflectivities. Also in Chapter 1, the predictive power of this methodology is demonstrated on a dataset from the

subsurface of the Molasse Basin in Upper Austria Beyond this dissertation Bernhardt et al in review adopted the methodology to support the development of a more predictive sedimentological model for the same dataset The second contribution presented in Chapter 2 is a new approach for building predictive quantitative spatial models for a deep water channel belt in which sand deposition is controlled by mass transport deposit topography This methodology leverages sedimentological interpretations derived from subseismic lithologic information as presented in Chapter 1 and the sedimentological work of Bernhardt et al in review The final contribution of this dissertation is presented in two outcrop studies Chapters 3 and 4 utilize extensive data collected from deep water channel outcrops to build digital outcrop models The model from Chapter 3 is used to demonstrate the predictive power of pre stack seismic reflectivity data in interpreting the large scale architecture of a heterolithic deep water channel system exposed in the sea cliffs along Blacks Beach near La Jolla California Finally the outcrop modeling study presented in Chapter 4 presents a methodology to capture structural and stratigraphic uncertainty in outcrop observations in order to analyze the three dimensional channel morphology of the Cerro Toro deep water channel belt exposed in Sierra del Toro outcrops in the Magallanes Basin of Chile These four chapters are described in more detail below
