Computer-Assisted Management and Control of Manufacturing Systems Spyros G. Tzafestas, 2012-12-06 Modern manufacturing systems involve many processes and operations that can be monitored and controlled at several levels of intelligence At the highest level there is a computer that supervises the various manufacturing functions whereas at the lowest level there are stand alone computer

controlled systems of manufacturing processes and robotic cells Until recently computer aided manufacturing systems constituted isolated islands of automation each oriented to a particular application but present day systems offer integrated approaches to manufacturing and enterprise operations These modern systems known as computer integrated manufacturing CIM systems can easily meet the current performance and manufacturing competitiveness requirements under strong environmental changes CIM systems are much of a challenge and imply a systemic approach to the design and operation of a manufacturing enterprise Actually a CIM system must take into account in a unified way the following three views the user view the technology view and the enterprise view This means that CIM includes both the engineering and enterprise planning and control activities as well as the information flow activities across all the stages of the system **Program**

Alphard: Form and Content Mary Shaw, 2012-12-06 Alphard is a design for a programming system that supports the abstraction and verification techniques required by modern programming methodology During the language design process we were concerned simultaneously with problems of methodology correctness and efficiency Methodological concerns are addressed through facilities for defining new task specific abstractions that capture complex notions in terms of their intended properties without explicating them in terms of specific low level implementations Techniques for verifying certain properties of these programs address the correctness concerns Finally the language has been designed to permit compilation to efficient object code Although a compiler was not implemented the research shed light on specification issues and on programming methodology an abstraction specifying its behavior Alphard language constructs allow a programmer to isolate publicly while localizing knowledge about its implementation The verification of such an abstraction consists of showing that

its implementation behaves in accordance with the public specification. Given such a verification, the abstraction may be used with confidence to construct higher level more abstract programs. The most common kind of abstraction in Alphasoft corresponds to what is now called an abstract data type. An abstract data type comprises a set of values for elements of the type and a set of operations on those values. A new language construct, the form, provides a way to encapsulate the definitions of data structures and operations in such a way that only public information could be accessed by the rest of the program.
