How Life Imitates Chess Garry Kasparov, 2010-08-10 Garry Kasparov was the highest rated chess player in the world for over twenty years and is widely considered the greatest player that ever lived In *How Life Imitates Chess* Kasparov distills the lessons he learned over a lifetime as a Grandmaster to offer a primer on successful decision making how to evaluate opportunities anticipate the future devise winning strategies He relates in a lively original way all the fundamentals from the nuts and bolts of strategy evaluation and preparation to the subtler more human arts of developing a personal style and using memory intuition imagination and even fantasy Kasparov takes us through the great matches of his career including legendary duels against both man Grandmaster Anatoly Karpov and machine IBM chess supercomputer Deep Blue enhancing the lessons of his many experiences with examples from politics literature sports and military history With candor wisdom and humor Kasparov recounts his victories and his blunders both from his years as a world class competitor as well as his new life as a political leader in Russia An inspiring book that combines unique strategic insight with personal memoir *How Life Imitates Chess* is a glimpse inside the mind of one of today's greatest and most innovative thinkers

Summary of Garry Kasparov's *How Life Imitates Chess* Everest Media, 2022-05-23T22:59:00Z Please

note This is a companion version not the original book Sample Book Insights 1 I was a young challenger up against a champion who had held the title for almost ten years I was twenty one years old and had risen to the top of the chess world with such speed that I couldn't imagine that this last hurdle could block my way 2 I became world champion and held the title for fifteen years When I retired in 2005 I was still the highest rated player in the world 3 Chess is neither a trivial pursuit nor an exercise limited to geniuses and supercomputers At the heart of the game is strategy and that is where we must begin 4 The distinction between tactics and strategy is important in chess business and life While strategy is abstract and based on long term goals tactics are concrete and based on finding the best move right now Without a goal your play will be aimless

Winter Is Coming Garry Kasparov, 2015-10-27 The stunning story of Russia's slide back into a dictatorship and how the West is now paying the price for allowing it to happen The ascension of Vladimir Putin a former lieutenant colonel of the KGB to the presidency of Russia in 1999 was a strong signal that the country was headed away from democracy Yet in the intervening years as America and the world's other leading powers have continued to appease him Putin has grown not only into a dictator but an international threat With his vast resources and nuclear arsenal Putin is at the center of a worldwide assault on political liberty and the modern world order For Garry Kasparov none of this is news He has been a vocal critic of Putin for over a decade even leading the pro democracy opposition to him in the farcical 2008 presidential election Yet years of seeing his Cassandra like prophecies about Putin's intentions fulfilled have left Kasparov with a darker truth Putin's Russia

like ISIS or Al Qaeda defines itself in opposition to the free countries of the world As Putin has grown ever more powerful the threat he poses has grown from local to regional and finally to global In this urgent book Kasparov shows that the collapse of the Soviet Union was not an endpoint only a change of seasons as the Cold War melted into a new spring But now after years of complacency and poor judgment winter is once again upon us Argued with the force of Kasparov's world class intelligence conviction and hopes for his home country Winter Is Coming reveals Putin for what he is an existential danger hiding in plain sight

Self-Organization in the Nervous System Yan M. Yufik, Biswa Sengupta, Karl Friston, 2017-11-30 This special issue reviews state of the art approaches to the biophysical roots of cognition These approaches appeal to the notion that cognitive capacities serve to optimize responses to changing external conditions Crucially this optimisation rests on the ability to predict changes in the environment thus allowing organisms to respond pre emptively to changes before their onset The biophysical mechanisms that underwrite these cognitive capacities remain largely unknown although a number of hypotheses has been advanced in systems neuroscience biophysics and other disciplines These hypotheses converge on the intersection of thermodynamic and information theoretic formulations of self organization in the brain The latter perspective emerged when Shannon's theory of message transmission in communication systems was used to characterise message passing between neurons In its subsequent incarnations the information theory approach has been integrated into computational neuroscience and the Bayesian brain framework The thermodynamic formulation rests on a view of the brain as an aggregation of stochastic microprocessors neurons with subsequent appeal to the constructs of statistical mechanics and thermodynamics In particular the use of ensemble dynamics to elucidate the relationship between micro scale parameters and those of the macro scale aggregation the brain In general the thermodynamic approach treats the brain as a dissipative system and seeks to represent the development and functioning of cognitive mechanisms as collective capacities that emerge in the course of self organization Its explicanda include energy efficiency enabling progressively more complex cognitive operations such as long term prediction and anticipatory planning A cardinal example of the Bayesian brain approach is the free energy principle that explains self organizing dynamics in the brain in terms of its predictive capabilities and selective sampling of sensory inputs that optimise variational free energy as a proxy for Bayesian model evidence An example of thermodynamically grounded proposals in this issue associates self organization with phase transitions in neuronal state spaces resulting in the formation of bounded neuronal assemblies neuronal packets This special issue seeks a discourse between thermodynamic and informational formulations of the self organising and self evidencing brain For example could minimization of thermodynamic free energy during the formation of neuronal packets underlie minimization of variational free energy
