Danny Harvey, 2012-08-21 Winner of Choice Magazine Outstanding Academic Titles for 2007 Buildings account for over one third of global energy use and associated greenhouse gas emissions worldwide Reducing energy use by buildings is therefore an essential part of any strategy to reduce greenhouse gas emissions and thereby lessen the likelihood of potentially catastrophic climate change Bringing together a wealth of hard to obtain information on energy use and energy efficiency in buildings at a level which can be easily digested and applied Danny Harvey offers a comprehensive objective and critical sourcebook on low energy buildings Topics covered include thermal envelopes heating cooling heat pumps HVAC systems hot water lighting solar energy appliances and office equipment embodied energy buildings as systems and community integrated energy systems cogeneration district heating and district cooling The book includes exemplary buildings and techniques from North America Europe and Asia and combines a broad holistic perspective with technical detail in an accessible and insightful manner *Heat Transfer in Industrial Combustion* Charles E. Baukal, Jr., 2000-05-26 Industry relies heavily on the combustion process The already high demand for energy primarily from combustion is expected to continue to rapidly increase Yet the information is scattered and incomplete with very little attention paid to the overall combustion system Designed for practicing engineers *Heat Transfer in Industrial Combustion e Combustion* Irvin Glassman, Richard A. Yetter, Nick G. Glumac, 2014-12-02 Throughout its previous four editions Combustion has made a very complex subject both enjoyable and understandable to its student readers and a pleasure for instructors to teach With its clearly articulated physical and chemical processes of flame combustion and smooth logical transitions to engineering applications this new edition continues that tradition Greatly expanded end of chapter problem sets and new areas of combustion engineering applications make it even easier for students to grasp the significance of combustion to a wide range of engineering practice from transportation to energy generation to environmental impacts Combustion engineering is the study of rapid energy and mass transfer usually through the common physical phenomena of

flame oxidation It covers the physics and chemistry of this process and the engineering applications including power generation in internal combustion automobile engines and gas turbine engines Renewed concerns about energy efficiency and fuel costs along with continued concerns over toxic and particulate emissions make this a crucial area of engineering New chapter on new combustion concepts and technologies including discussion on nanotechnology as related to combustion as well as microgravity combustion microcombustion and catalytic combustion all interrelated and discussed by considering scaling issues e g length and time scales New information on sensitivity analysis of reaction mechanisms and generation and application of reduced mechanisms Expanded coverage of turbulent reactive flows to better illustrate real world applications Important new sections on stabilization of diffusion flames for the first time the concept of triple flames will be introduced and discussed in the context of diffusion flame stabilization
