Hadoop Real-World Solutions Cookbook Mulhim Morcos, 2014-11-03 Big data is a relative term describing a situation where the volume velocity and variety of data exceed an organization's storage or compute capacity for accurate and timely decision making Big data is not a single technology but a combination of old and new technologies that helps companies gain actionable insight Therefore big data is the capability to manage a huge volume of disparate data at the right speed and within the right time frame to allow real time analysis and reaction As we note earlier in this chapter big data is typically broken down by three characteristics Volume How much data Velocity How fast that data is processed Variety The various types of data Although it's convenient to simplify big data into the three Vs it can be misleading and overly simplistic For example you may be managing a relatively small amount of very disparate complex data or you may be processing a huge

volume of very simple data That simple data may be all structured or all unstructured Even more important is the fourth V
 veracity How accurate is that data in predicting business value Do the results of a big data analysis actually make sense
 Determining relevant data is key to delivering value from massive amounts of data However big data is defined less by
 volume which is a constantly moving target than by its ever increasing variety velocity variability and complexity **Hadoop**
