Construction Manual for Polymers + Membranes Jan Knippers, Jan Cremers, Markus Gabler, Julian Lienhard, 2012-12-17 Whether it be as translucent sheets broadly stretched membranes and inflated foil cushions or in graceful organic curves architecture today is utilizing plastics in the most disparate forms and for a wide variety of purposes Innovative technical developments are constantly improving its material properties at the same time there is a growing new awareness of its potential as a construction material While plastics used to be employed primarily as an inexpensive variant on traditional building materials they are increasingly regarded in the construction world today as a serious and viable alternative be it as supporting structures roofs facades or elements of interior design and decoration Thanks in large part to this inherent self sufficiency plastics are currently enjoying an unprecedented surge in popularity even among the international architectural avant garde as multiwall sheets or corrugated fiber reinforced panels or as filling between glass panes And the new generation of ecological bioplastics also pays tribute to the debate on sustainability ridding plastics of their lingering reputation as environmental offenders From the history of plastics and membranes in architecture to their material properties and requirements in construction and design the Plastics and Membranes Construction Manual cuts to the chase providing the kind of solid and comprehensive overview of the subject that readers have come to expect from the Im DETAIL series Selected project examples round off the reference work and make it indispensable for the day to day life of the professional planner and for every architecture library

Notes on Advanced Structured Materials Holm Altenbach, Michael Johlitz, Markus Merkel, Andreas Öchsner, 2022-12-02

The book on advanced structured materials is designed to facilitate teaching and informal discussion in a supportive and friendly environment. The book provides a forum for postgraduate students to present their research results and train their presentation and discussion skills. Furthermore, it allows for extensive discussion of current research being conducted in the wider area of advanced structured materials. Doing so, it builds a wider postgraduate community and offers networking opportunities for early career researchers. In addition to focused lectures, the book provides specialized teaching overview lectures from experienced senior academics. The 2022 Postgraduate Seminar entitled Advanced Structured Materials Development Manufacturing Characterization Applications was held from February 28th till March 4th 2022 in Malta. The book that presented postgraduate lectures had a strong focus on polymer mechanics, composite materials, and additive manufacturing.

Specialized Injection Molding Techniques Hans-Peter Heim, 2015-11-02. Special Injection Molding Techniques covers several techniques used to create multicomponent products, hollow areas, and hard/soft combinations that cannot be produced with standard injection molding processes. It also includes information on the processing techniques of special materials, including foaming agents, bio-based materials, and thermosets. The book describes the most industrially relevant special injection molding techniques with a detailed focus on understanding the basics of each technique and its main mechanisms, i.e., temperature, mold filling, bonding, residual stresses, and material behavior, also providing an explanation of process routes and their variants and discussions of the most influencing process parameters. As special molding technologies have the potential to transform plastics processing to a highly efficient, integrated type of manufacturing, this book provides a timely survey of these technologies, putting them into context, accentuating new opportunities, and giving relevant information on processing. Provides information about the basics needed for understanding several special injection molding techniques, including flow phenomena, bonding mechanisms, and thermal behavior. Covers the basics of each technique and its main mechanisms, i.e., temperature, mold filling, bonding, residual stresses, and material behavior. Discusses the most relevant processing parameters for each injection molding technique. Presents a variety of techniques, including gas and water-assisted injection molding, multi-component injection molding, hybrid injection molding, injection molding of bio-based materials, and techniques for thermoset.

Modeling Methods for Process Induced Distortions of CFRP-Parts produced in the Prepreg-Autoclave-Process Tim Frerich, 2023-06-20 Process induced distortions are a challenge in the production of high performance components made of carbon fiber reinforced plastics In order to prevent the distortions a prediction is of great utility For components manufactured in the prepreg autoclave process which is often used in the aerospace industry prediction methods are investigated within this work First the state of the art is discussed and based on this two promising approaches are identified which are further investigated and

implemented A rapid simulation approach and a complex one which requires more effort but allows further investigations of the distortions For the latter approach new material models and rules of mixture are developed that take into account modern material architectures with interleaf layers Using these material models the observed material behavior can be represented more accurately than with material models from the literature The results obtained by both approaches are compared with experimental results A good agreement can be shown between the measurements and the simulation

Weber, 2019-10-02 The use of plastic metal hybrid components in transmission housings opens up a new possibility for lightweight construction Closed housing structures made of a single material can be replaced by open load optimized housing structures that offer an otherwise unattainable weight advantage through the use of plastics The investigation of the bond strength between metal and plastic is an essential part of this work The adhesion promoters investigated make it clear that there are currently no systems known to the author that can improve the bond strength of not only freshly molded components in the long term The shot peening process already used for a large number of transmission housing types also opens up advantages for plastic metal hybrid components The microstructured surface enables the plastic to fill in undercuts and cavities in the molten state and thus to form an improved adhesive strength through microform closure If the adhesive strength is essentially based on a material locking connection a blasted surface can achieve considerable increases in the strength of the plastic metal connection Force fit and positive connections on the other hand benefit less from a blasted surface of the metal Investigations into the influence of the joining geometry on the bond strength showed that geometries with pronounced joining characteristics achieve the greatest bond strength It could be shown that of all geometric features the increase of the undercut surface in the pull out direction has the greatest influence on the bond strength A further aim of this work is to investigate the tightness of the hybrid components A test specimen close to the component was developed for this purpose The leakage tests were then carried out on dry as molded and conditioned components under series test conditions The adhesion promoter systems which were disappointing in terms of bond strength were not convincing in this test criterion either Another approach to tighten the test specimen based on the modification of the joining geometry also had to be accepted as impracticable The expectations that the shrinkage of the plastic resulting from the injection molding process could be used to improve the tightness by a skillful choice of the joining geometry were not fulfilled The use of additional sealing elements which are inserted into the mold together with the aluminum part and encapsulated by the plastic finally turned out to be the right way The features of a plastic metal hybrid connection investigated in this paper were able to meet the expectations for use in transmission housings This could either be achieved with already proven means such as a shot peened surface or after research work such as the insertion of an additional sealing element *Polymer*
