Exploitation of Linkage Learning in Evolutionary Algorithms Ying-ping Chen, 2010-04-16 One major branch of enhancing the performance of evolutionary algorithms is the exploitation of linkage learning. This monograph aims to capture the recent progress of linkage learning by compiling a series of focused technical chapters to keep abreast of the developments and trends in the area of linkage. In evolutionary algorithms, linkage models the relation between decision variables with the genetic linkage observed in biological systems and linkage learning connects computational optimization methodologies and natural evolution mechanisms. Exploitation of linkage learning can enable us to design better evolutionary algorithms as well as to potentially gain insight into biological systems. Linkage learning has the potential to become one of the dominant aspects of evolutionary algorithms research in this area can potentially yield promising results in addressing the scalability issues.

Unified Computational Intelligence for Complex Systems John Seiffertt, Donald C. Wunsch, 2010-07-15 Computational intelligence encompasses a wide variety of techniques that allow computation to learn to adapt and to seek. That is, they may be designed to learn information without explicit programming regarding the nature of the content to be retained; they may be imbued with the functionality to adapt to maintain their course within a complex and unpredictably changing environment and they may help us seek out truths about our own dynamics and lives through their inclusion in complex system modeling. These capabilities place our ability to compute in a category apart from our ability to erect suspension bridges, although both are products of technological advancement and reflect an increased understanding of our world. In this book, we show how to unify aspects of learning and adaptation within the computational intelligence framework. While a number of algorithms exist that fall under the umbrella of computational intelligence, with new ones added every year, all of them focus on the capabilities of learning, adapting and helping us seek. So the term unified computational intelligence relates not to the individual algorithms but to the underlying goals driving them. This book focuses on the computational intelligence areas of neural networks and dynamic programming, showing how to unify aspects of these areas to create new, more powerful computational intelligence architectures to apply to new problem domains.

Sarker and Tapabrata Ray, 2010-07-12. Agent-based evolutionary search is an emerging paradigm in computational intelligence offering the potential to conceptualize and solve a variety of complex problems such as currency trading, production planning, disaster response management, business process management, etc. There has been a significant growth in the number of publications related to the development and applications of agent-based systems in recent years, which has prompted special issues of journals and dedicated sessions in premier conferences. The notion of an agent with its ability to sense, learn, and act autonomously allows the development of a plethora of efficient algorithms to deal with complex problems. This notion of an agent differs significantly from a restrictive definition of a solution in an evolutionary algorithm and opens up the possibility to model and capture emergent behavior of complex systems through a natural, age-oriented decomposition of the problem space. While this flexibility of representation offered by agent-based systems is widely acknowledged, they need to be designed for specific purposes, capturing the right level of details and description. This edited volume is aimed to provide the readers with a brief background of agent-based evolutionary search, recent developments, and studies dealing with various levels of information abstraction and applications of agent-based evolutionary systems. There are 12 peer-reviewed chapters in this book, authored by distinguished researchers who have shared their experience and findings spanning across a wide range of applications.

Shanghai Sacred by Benoît Vermander, Liz Hingley, and Liang Zhang, 2018-04-15. Shanghai, a dynamic world metropolis, is home to a multitude of religions, from Buddhism and Islam to Christianity and Baha'ism to Hinduism and Daoism and many more. In this city of 24 million inhabitants, new religious groups and older faiths together claim and reclaim spiritual space. *Shanghai Sacred* explores the spaces, rituals, and daily practices that make up the religious landscape of the city, offering a new paradigm for the study of Chinese spirituality that reflects the global trends shaping Chinese culture and civil society. Based on years of fieldwork incorporating both comparative and methodological perspectives, *Shanghai Sacred* demonstrates how religions are lived, constructed, and thus inscribed into the social imaginary of the metropolis. Evocative photographs by Liz Hingley enrich and interact with the narrative, making the book an innovative contribution to religious visual ethnography.
