

Objectives

upon completion of this chapter, you will be able to:

1. Understand various operating costs of a power system.
2. Determine the load sharing between different generators for minimum cost dispatch.

Introduction

The efficient and optimum economic operation of electric power generation systems has occupied an important position in the electric power industry. Economic operation is very important for a power system to return a profit on the capital invested.

The optimum operation of the system involves the consideration of economy of operation, system security, emissions at a certain fossil-fuel plants. The hydrothermal coordination problem is another optimum operating problem area that has received a great deal of attention. Another factor that influences the power generation at minimum cost is transmission losses.

The most efficient generator in the system does not guarantee minimum cost as it may be located in an area where fuel cost is high. Also, if the plant is located far from the load centre, transmission loss may be higher, and hence the plant may be uneconomical.

The basic objective is to determine the generation of different plants, such that total operating cost is minimum. The operating cost plays an important role in economic scheduling.

Generator Operating Cost

The total generation cost includes fuel, labour, and maintenance costs. In case of economic load dispatch, the generations are not fixed, but they are allowed to take values within certain allowable limits so as to meet a particular load demand with minimum fuel consumption. The total cost of generation is a function of the individual generation of the sources, which can take values within certain constraints; the cost of generation will depend on system constraints for a particular load demand. In this section, we will only consider fuel costs because other costs cannot be optimised based on generation.

We usually express instead of cost (P_g) , input energy rate $F(P_g)$ [Mkcal/h] because fuel cost may change daily/monthly.

Heat rate curve $H(P_g)$ is heat energy in Mkcal need to generate one unit of electrical energy (kWh). Based on experimental data for a plant the heat rate curve is plotted in Figure 3.1.

Iliadis, Mario V. F. Pereira, 2012-03-01 Energy has been an inevitable component of human lives for decades. Recent rapid developments in the area require analyzing energy systems not as independent components but rather as connected interdependent networks. The Handbook of Networks in Power Systems includes the state of the art developments that occurred in the power systems networks in particular gas electricity liquid fuels freight networks as well as their interactions. The book is separated into two volumes with three sections where one scientific paper or more are included to cover most important areas of networks in power systems. The first volume covers topics arising in electricity network in particular electricity markets smart grid network expansion as well as risk management. The second volume presents problems arising in gas networks such as scheduling and planning of natural gas systems pricing as well as optimal location of gas supply units. In addition, the second volume covers the topics of interactions between energy networks. Each subject is identified following the activity on the domain and the recognition of each subject as an area of research. The scientific papers are authored by world specialists on the domain and present either state of the arts reviews or scientific developments. *PICA Conference Proceedings*, 1979 *IEEE Conference Proceedings*, 1979 **Energy Research Abstracts**, 1992 **Energy**, 1983 **Westinghouse Engineer**, 1964 **Directory of Energy Information Administration Models (1992)** DIANE Publishing Company, **Catalog of Copyright Entries.
