Measurement Burst Designs to Improve Precision in Peer Research Ryan J. Persram, Bianca Panarello, Melisa Castellanos, Lisa Astrologo, William M. Bukowski, 2021-10-14. Measurement burst designs, in which assessments of a set of constructs are made at two or more times in quick succession (e.g., within days), can be used as a novel method to improve the stability of basic measures typically used in longitudinal peer research. In this Element, we hypothesized that the stabilities for adolescent-reported peer acceptance, anxiety, and self-concept would be stronger when using the measurement burst approach versus the single-time observation. Participants included youth between 10 and 13 years old who completed sociometric assessments of acceptance and measures of social and test anxiety and self-concept across three times, with two assessments made at each burst. Findings broadly showed that the stabilities were significantly stronger with the measurement burst when compared to the single-time assessment, supporting our main hypothesis. We discuss the utility of the measurement burst in a broader context and considerations for researchers.
