tools airbags in cars and autopilots for aircraft control are only some examples that illustrate how everyday life depends on the good behavior of software. Consequently techniques and methods for the development of high quality dependable software systems are a central research topic in computer science. A fundamental approach to this area is to use formal specification and verification. Specification languages allow one to describe the crucial properties of software systems in an abstract, mathematically precise and implementation independent way. By formal verification one can then prove that an implementation really has the desired specified properties. Although this formal methods approach has been a research topic for more than 30 years its practical success is still restricted to domains in which development costs are of minor importance. Two aspects are crucial to widen the application area of formal methods. Formal specification techniques have to be smoothly integrated into the software and program development process. The techniques have to be applicable to reusable software components. This way the quality gain can be exploited for more than one system thereby justifying the higher development costs. Starting from these considerations Peter Muller has developed new techniques for the formal specification and verification of object oriented software. The specification techniques are declarative and implementation independent. They can be used for object oriented design and programming.
