Arnon,2012-12-02 Throughout history man has by over use consistently reduced the productive capacity of dry lands This degradation of one third of the land area of the globe is unfortunately increasing In recent years world interest has turned to the problems of pollution of the environment and the impending food shortage as world population grows explosively Thus the attention of international and other agricultural bodies has turned to the need for preserving and developing more effectively the agricultural potential of these areas This book provides a comprehensive review of present knowledge of the agriculture of dry lands with special emphasis on measures for conserving their natural resources Management practices are described which aim at optimizing productivity of rainfed and irrigated agriculture without adverse effects on sustainability Land use in the dry regions and its

evolution throughout history is described and analysed and the lessons to be learnt from destructive technologies are stressed In particular current proposals for an alternative agriculture are discussed and their justification is questioned This is a generalist work which specialists can also find interesting not only in their own discipline but as a concise way of acquainting themselves with the state of the art in associated fields Increasing specialisation with each discipline using its own vocabulary leads inevitably to communication problems and the need for multi disciplinary teams makes inter discipline communication indispensable

Food from dry lands Th. Alberda, H. van Keulen, N.G. Seligman, C.T. de Wit, 2012-12-06 In the early seventies scientists in Israel and The Netherlands started a cooperative project on actual and potential production under semi arid conditions In Israel research concentrated on primary production of natural pastures and small grain crops and on the associated secondary production of small ruminants Most of the experimental work was carried out at the Migda Experimental Farm in the semi desert of the northern Negev where the long term average annual rainfall is 250 mm In The Netherlands existing facilities in Wageningen were used for measuring growth photosynthesis and transpiration of Negev pasture plants and small grains under controlled conditions both as individual plants and as simulated swards and crops The joint research program was initiated by the late N H Tadmor and A Dovrat from Israel and by C T de Wit and Th Alberda from The Netherlands and conducted by various scientists from both countries some of whom are among the authors of this book The experimental results first served as a basis for the development calibration and validation of simulation models of the growth and water use of pasture and crops Subsequently additional models were developed allowing incorporation of socio economic considerations both at the farm and regional level so harnessing the research results for analysis of regional development possibilities
