Pearson, 2013-09-17 A Handbook of Lattice Spacing and Structures of Metals and Alloys is a 12 chapter handbook that describes the structures and lattice spacings of all binary and ternary alloys This book starts with an introduction to the accurate determination of structure and lattice spacings The subsequent chapters deal with the role of structure determination and lattice spacings in alloy formation as well as the application of this determination to the equilibrium diagram examination These topics are followed by discussions on the correlation of lattice spacing and magnetic property including X ray crystallographic data for those structures allotted a Strukturbericht type The remaining chapters contain table lists information about the crystal structures densities and expansion coefficients of the elements These chapters also present further information about lattice spacing and structure determination on metals in alphabetical order This book is of value to physicists and metallurgists      *Planar Processing Primer* G. Anner, 2012-12-06 Planar Processing Primer is based on lecture notes for a silicon planar processing lecture lab course offered at the University of Illinois UC for over fifteen years Directed primarily to electrical engineering upperclassmen and graduate students the material also has been used successfully by graduate students in physics and ceramic and metallurgical engineering It is suitable for self study by engineers trained in other disciplines who are beginning work in the semiconductor fields and it can make circuit design engineers aware of the processing limitations under which they must work The text describes and explains at an introductory level the principal processing steps used to convert raw silicon into a semiconductor device or integrated circuit First order models are used for theoretical treatments e g of diffusion and ion implantation with reference made to more advanced treatments to computer programs such as SUPREM that include higher order effects and to interactions among sequential processes In Chapters 8 9 and to the application of silicon processes to compound semiconductors is discussed briefly Over the past several years the size of transistors has decreased markedly allowing more transistors per chip unit area and chip size has increased      **The Magellanic Clouds** Bengt E. discussions on the development of spectrochemical methods chemical and radiochemical methods of determination of radionuclides in human bones and tissues and the toxic effects of combined drug action The last chapter examines the poison residue occurrence in human tissues This book is of great value to toxicologists and public health workers and researchers

The University of Cambridge A game changer In the tradition of Thomas Kuhn's *The Structure of Scientific Revolutions* this lucidly written penetrating analysis challenges us to rethink many things we take for granted about ourselves our society and our universe It will become a classic Peter Dreier E P Clapp Distinguished Professor of Politics Occidental College Hands is an astute observer of recent trends in scientific ideas bold enough to point out what he sees as sense and nonsense and intelligently explain why Even in cases where one might disagree the arguments are thought provoking Paul Steinhardt Albert Einstein Professor in Science Princeton University **Structure Reports** ,1989 *Physics Briefs* ,1994 Travels Through Germany, Bohemia, Hungary, Switzerland, Italy, and Lorrain Johann Georg Keyssler,1757 **Epitope Discovery and Synthetic Vaccine Design** Clarisa Beatriz Palatnik-de-Sousa,Irene da Silva Soares,Daniela Santoro Rosa,2018-07-12

Since variolation conventional approaches to vaccine development are based on live attenuated inactivated or purified pathogen derived components However effective vaccines against global health threats such as HIV parasite infections and tumors are difficult to achieve On the other hand synthetic vaccines based on immunogenic epitopes offer advantages over traditional vaccines since they are chemically defined antigens free from deleterious effects Additionally in contrast to live attenuated vaccines they do not revert to virulence in immunocompromised subjects and different from genetic vaccines they do not involve ethical questions Traditional vaccines contain PAMPs and induce strong immune responses while recombinant vaccines are less potent In spite of the immunogenic weakness previously attributed to epitope based vaccines a synthetic vaccine containing a 17 amino acid epitope of the *Pseudomonas aeruginosa* Type IV pilus exceeded the protective potential of its cognate protein composed of 115 amino acids Therefore the efficacy yield of a synthetic vaccine can be potentiated by using the proper combination of target epitopes Recent advances in adjuvant development immunogen platforms for DNA vaccines and viral vectors also contributed to optimize immunogenicity Another constraint to the use of epitope vaccines was their restriction to some MHC or HLA phenotypes However epitopes containing 20 or less amino acids of *Plasmodium falciparum* and *Leishmania donovani* bind to multiple HLA DR and MHC receptors Thus synthetic epitope vaccines may better meet the requirements of the regulatory agencies since they have lower costs and are easier to produce The classical experimental approach for the development of an epitope based vaccine involves the use of recombinant domains or overlapping 15 mer peptides spanning the full length of the target antigen and the analysis of the induced antibody and or T cell immune responses in vitro or in vivo On the other hand in silico tools can select peptides that are more likely to contain epitopes reducing the number of sequence candidates T cell epitope prediction dates back to 1980s when the first algorithm was developed based on the identification of amphipathic helical regions on protein antigens Since then new methods based on MHC peptide binding motifs or MHC binding properties have been developed The recent reverse vaccinology concept uses high throughput genome sequencing and bioinformatics tools to identify potential targets of immune responses The feasibility of this approach was shown for the first time in the design of a vaccine against *Neisseria meningitidis* that is now

in phase III clinical trials In addition different computational tools allow the determination of crucial gene s through comparative analyses between different pathogenic strains Alternatively carbohydrates have been considered as key targets in developing safe and effective vaccines to combat cancer bacterial and viral infections Tumor associated carbohydrate antigens can be coupled covalently to protein carriers to target MHC receptors and improve immunogenicity and have reached already pre clinical and clinical studies In light of the recent availability of genomic tools we believe that in the near future an increasing number of vaccine candidates composed of defined epitopes will be available for synthetic vaccines showing improved protection
