Linear Models in Matrix Form Jonathon D. Brown, 2015-02-28 **Linear Models in Matrix Form** Jonathon D.

Brown, 2015-01-21 This textbook is an approachable introduction to statistical analysis using matrix algebra. Prior knowledge of matrix algebra is not necessary. Advanced topics are easy to follow through analyses that were performed on an open source spreadsheet using a few built-in functions. These topics include ordinary linear regression as well as maximum likelihood estimation, matrix decompositions, nonparametric smoothers, and penalized cubic splines. Each data set 1 contains a limited number of observations to encourage readers to do the calculations themselves, and 2 tells a coherent story based on statistical significance and confidence intervals. In this way, students will learn how the numbers were generated and how they can be used to make cogent arguments about everyday matters. This textbook is designed for use in upper-level undergraduate courses or first-year graduate courses. The first chapter introduces students to linear equations, then covers matrix algebra focusing on three essential operations: sum of squares, the determinant, and the inverse. These operations are explained in everyday language, and their calculations are demonstrated using concrete examples. The remaining chapters build on these operations, progressing from simple linear regression to mediational models with bootstrapped standard errors.

Advanced Statistics for the Behavioral Sciences Jonathon D. Brown, 2019-04-30 This book demonstrates the importance of computer-generated statistical analyses in behavioral science research, particularly those using the R software environment. Statistical methods are being increasingly developed and refined by computer scientists with expertise in writing efficient and elegant computer code. Unfortunately, many researchers lack this programming background, leaving them to accept on faith the black box output that emerges from the sophisticated statistical models they frequently use. Building on the author's previous volume, *Linear Models in Matrix Form*, this text bridges the gap between computer science and research application, providing easy-to-follow computer code for many statistical analyses using the R software environment. The text opens with a foundational section on linear algebra, then covers a variety of advanced topics, including robust regression, model selection based on bias and efficiency, nonlinear models, and optimization routines, generalized linear models, and survival and time series analysis. Each section concludes with a presentation of the computer code used to illuminate the analysis, as well as pointers to packages in R that can be used for similar analyses and nonstandard cases. The accessible code and breadth of topics make this book an ideal tool for graduate students or researchers in the behavioral sciences who are interested in performing advanced statistical analyses without having a sophisticated background in computer science and mathematics.

New Developments in Categorical Data Analysis for the Social and Behavioral Sciences L. Andries van der Ark, Marcel A. Croon, Klaas Sijtsma, 2005-01-15 Categorical data are quantified as either nominal variables distinguishing different groups, for example based on socio-economic status, education, and political persuasion, or ordinal variables distinguishing levels of interest, such as the preferred politician or the preferred type of punishment for committing burglary. This new book is a

collection of up to date studies on modern categorical data analysis methods emphasizing their application to relevant and interesting data sets This volume concentrates on latent class analysis and item response theory These methods use latent variables to explain the relationships among observed categorical variables Latent class analysis yields the classification of a group of respondents according to their pattern of scores on the categorical variables This provides insight into the mechanisms producing the data and allows the estimation of factor structures and regression models conditional on the latent class structure Item response theory leads to the identification of one or more ordinal or interval scales In psychological and educational testing these scales are used for individual measurement of abilities and personality traits The focus of this volume is applied After a method is explained the potential of the method for analyzing categorical data is illustrated by means of a real data example to show how it can be used effectively for solving a real data problem These methods are accessible to researchers not trained explicitly in applied statistics This volume appeals to researchers and advanced students in the social and behavioral sciences including social developmental organizational clinical and health psychologists sociologists educational and marketing researchers and political scientists In addition it is of interest to those who collect data on categorical variables and are faced with the problem of how to analyze such variables among themselves or in relation to metric variables

Bayesian Methods Jeff Gill, 2014-12-11 An Update of the Most Popular Graduate Level Introductions to Bayesian Statistics for Social Scientists Now that Bayesian modeling has become standard MCMC is well understood and trusted and computing power continues to increase Bayesian Methods A Social and Behavioral Sciences Approach Third Edition focuses more on implementation details of the Regression-Based Normative Data for Psychological Assessment Wim Van der Elst, 2024-06-03 Over the last 20 years so called regression based normative methods have become increasingly popular In this approach regression models for the mean and the residual variance structure are used to derive the normative data The regression based normative approach has some important advantages over the traditional normative approach e g it allows for deriving more fine grained norms and typically requires a substantially smaller sample size to derive accurate norms This book focuses on regression based methods to derive normative data The target audience are psychologists and other researchers in the behavioral sciences who are interested in deriving normative data for psychological tests e g cognitive tests questionnaires rating scales etc The book provides the essential theoretical background that is needed to understand the methodology with a strong emphasis on the practical real life application of the methodology To this end the book is also accompanied by an open source software package the R library NormData that is used to exemplify how normative data can be derived in several case studies
