Neurobiology of Chemical Communication Carla Mucignat-Caretta, 2014-02-14 Intraspecific communication involves the activation of chemoreceptors and subsequent activation of different central areas that coordinate the responses of the entire organism ranging from behavioral modification to modulation of hormones release Animals emit intraspecific chemical signals often referred to as pheromones to advertise their presence to members of the same species and to regulate interactions aimed at establishing and regulating social and reproductive bonds In the last two decades scientists have developed a greater understanding of the neural processing of these chemical signals *Neurobiology of Chemical Communication* explores the role of the chemical senses in mediating intraspecific communication Providing an up to date outline of the most recent advances in the field it presents data from laboratory and wild species ranging from invertebrates to vertebrates from insects to humans The book examines the structure anatomy electrophysiology and molecular biology of pheromones It discusses how chemical signals work on different mammalian and non mammalian species and includes chapters on insects *Drosophila* honey bees amphibians mice tigers and cattle It also explores the controversial topic of human pheromones An essential reference for students and researchers in the field of pheromones this is also an ideal resource for those working on behavioral phenotyping of animal models and persons interested in the biology ecology of wild and domestic species

What a Bee Knows Stephen L. Buchmann, 2023-03-07 For many of us the buzzing of a bee elicits panic But the next time you hear that low droning sound look closer the bee has navigated to this particular spot for a reason using a fascinating set of tools She may be using her sensitive olfactory organs which provide a 3D scent map of her surroundings She may be following visual landmarks or instructions relayed by a hive mate She may even be tracking electrostatic traces left on flowers by other bees *What a Bee Knows Exploring the Thoughts Memories and Personalities of Bees* invites us to follow bees mysterious paths and experience their alien world Although their brains are incredibly small just one million neurons compared to humans 100 billion bees have remarkable abilities to navigate learn communicate and remember In *What a Bee Knows* entomologist Stephen Buchmann explores a bee's way of seeing the world and introduces the scientists who make the journey possible We travel into the field and to the laboratories of noted bee biologists who have spent their careers digging into the questions most of us never thought to ask for example Do bees dream And if so why With each discovery Buchmann's insatiable curiosity and sense of wonder is infectious *What a Bee Knows* will challenge your idea

of a bee's place in the world and perhaps our own. This lively journey into a bee's mind reminds us that the world is more complex than our senses can tell us. *Invertebrate Learning and Memory* Randolph Menzel, Paul Benjamin, 2013-06-18

Understanding how memories are induced and maintained is one of the major outstanding questions in modern neuroscience. This is difficult to address in the mammalian brain due to its enormous complexity and invertebrates offer major advantages for learning and memory studies because of their relative simplicity. Many important discoveries made in invertebrates have been found to be generally applicable to higher organisms and the overarching theme of the proposed will be to integrate information from different levels of neural organization to help generate a complete account of learning and memory. Edited by two leaders in the field, *Invertebrate Learning and Memory* will offer a current and comprehensive review with chapters authored by experts in each topic. The volume will take a multidisciplinary approach exploring behavioral, cellular, genetic, molecular, and computational investigations of memory. Coverage will include comparative cognition at the behavioral and mechanistic level, developments in concepts and methodologies that will underlie future advancements, and mechanistic examples from the most important vertebrate systems: nematodes, molluscs, and insects. Neuroscience researchers and graduate students with an interest in the neural control of cognitive behavior will benefit, as will those in the field of invertebrate learning. Presents an overview of invertebrate studies at the molecular, cellular, neural levels and correlates findings to mammalian behavioral investigations. Linking multidisciplinary approaches allows for full understanding of how molecular changes in neurons and circuits underpin behavioral plasticity. Edited work with chapters authored by leaders in the field around the globe, the broadest, most expert coverage available. Comprehensive coverage synthesizes widely dispersed research serving as one stop shopping for comparative learning and memory researchers. **The Mechanisms of Insect Cognition** Martin Giurfa, Jeffrey A. Riffell, Lars Chittka, 2020-03-12
