Magnetic Functions Beyond The Spin Hamiltonian Structure And Bonding:

Magnetic Functions Beyond the Spin-Hamiltonian R. Boca, 2006-01-12 Using the spin Hamiltonian formalism this work introduces the magnetic parameters through the components of the Lambda tensor involving only the matrix elements of the angular momentum operator It presents theoretical formulae necessary in performing the energy level calculations for a multi term system

Magnetic Functions Beyond the Spin-Hamiltonian David Michael P. Mingos, 2010-11-22 Using the spin Hamiltonian formalism the magnetic parameters are introduced through the components of the Lambda tensor involving only the matrix elements of the angular momentum operator The energy levels for a variety of spins are generated and the modeling of the magnetization the magnetic susceptibility and the heat capacity is done Theoretical formulae necessary in performing the energy level calculations for a multi term system are prepared with the help of the irreducible tensor operator approach The goal of the programming lies in the fact that the entire relevant matrix elements electron repulsion crystal field spin orbit interaction orbital Zeeman and spin Zeeman operators are evaluated in the basis set of free atom terms The modeling of the zero field splitting is done at three levels of sophistication The spin Hamiltonian formalism offers simple formulae for the magnetic parameters by evaluating the matrix elements of the angular momentum operator in the basis set of the crystal field terms The magnetic functions for dn complexes are modeled for a wide range of the crystal field strengths

W. M. Hofmann, Liudmila N. Kuleshova, 2009-11-26 Humans have been manually extracting patterns from data for centuries but the increasing volume of data in modern times has called for more automatic approaches Early methods of identifying patterns in data include Bayes theorem 1700s and Regression analysis 1800s The proliferation ubiquity and increasing power of computer technology has increased data collection and storage As data sets have grown in size and complexity direct hands on data analysis has increasingly been augmented with indirect automatic data processing Data mining has been developed as the tool for extracting hidden patterns from data by using computing power and applying new techniques and methodologies for knowledge discovery This has been aided by other discoveries in computer science such as Neural networks Clustering Genetic algorithms 1950s Decision trees 1960s

and Support vector machines 1980s Data mining commonly involves four classes of tasks Classification Arranges the data into predefined groups For example an e mail program might attempt to classify an e mail as legitimate or spam Common algorithms include Nearest neighbor Naive Bayes classifier and Neural network Clustering Is like classification but the groups are not predefined so the algorithm will try to group similar items together Regression Attempts to find a function which models the data with the least error A common method is to use Genetic Programming Association rule learning Searches for relationships between variables For example a supermarket might gather data of what each customer buys

Molecular Networks Mir Wais Hosseini, 2009-06-29 In the future many modern materials will be increasingly based on the assembly of preformed molecular entities Their structural characteristics and functional properties will be programmed at the molecular level and their formation as a completed entity will be achieved by self assembly processes This in essence is a bottom up approach and its success will require a deep understanding not only of the chemistry of intermolecular interactions and associations but also of self assembly processes in the condensed phase Among various interesting innovations brought about by the development of supramolecular chemistry supramolecular synthesis is a particularly powerful approach for the design and generation of molecular architectures displaying both structural and functional complexity The combination of molecular synthesis which allows chemists to design and prepare extremely sophisticated biotic and abiotic molecules through the interconnection of atoms or group of atoms by strong covalent bonds and supramolecular synthesis which orchestrates the association of molecules by recognition processes through the use of weak and reversible interactions opens up endless structural and functional possibilities Following the perceptive observation by Dunitz that A crystal is in a sense the supramolecule par excellence molecular crystals may be seen as infinite periodic architectures resulting from the interconnection of building blocks or tectons capable of self assembling through specific recognising events
