Sellmyer, Daisuke Shindo, 2008-11-23 In December 2002 the world's first commercial magnetic levitation super train went into operation in Shanghai The train is held just above the rails by magnetic levitation maglev and can travel at a speed of 400 km/hr completing the 30km journey from the city to the airport in minutes Now consumers are enjoying 50 GB hard drives compared to 0.5 GB hard drives ten years ago Achievements in magnetic materials research have made dreams of a few decades ago reality The objective of the four volume reference Handbook of Advanced Magnetic Materials is to provide a comprehensive review of recent progress in magnetic materials research Each chapter will have an introduction to give a clear definition of basic and important concepts of the topic The details of the topic are then elucidated theoretically and experimentally New ideas for further advancement are then discussed Sufficient references are also included for those who wish to read the original work In the last decade one of the most significant thrust areas of materials research has been nanostructured magnetic materials There are several critical sizes that control the behavior of a magnetic material and size effects become especially critical when dimensions approach a few nanometers

where quantum phenomena appear The first volume of the book Nanostructured Advanced Magnetic Materials has therefore been devoted to the recent development of nanostructured magnetic materials emphasizing size effects Our understanding of magnetism has advanced with the establishment of the theory of atomic magnetic moments and itinerant magnetism Simulation is a powerful tool for exploration and explanation of properties of various magnetic materials Simulation also provides insight for further development of new materials Naturally before any simulation can be started a model must be constructed This requires that the material be well characterized Therefore the second volume Characterization and Simulation provides a comprehensive review of both experimental methods and simulation techniques for the characterization of magnetic materials After an introduction each section gives a detailed description of the method and the following sections provide examples and results of the method Finally further development of the method will be discussed The success of each type of magnetic material depends on its properties and cost which are directly related to its fabrication process Processing of a material can be critical for development of artificial materials such as multilayer films clusters etc Moreover cost effective processing usually determines whether a material can be commercialized In recent years processing of materials has continuously evolved from improvement of traditional methods to more sophisticated and novel methods The objective of the third volume Processing of Advanced Magnetic Materials is to provide a comprehensive review of recent developments in processing of advanced magnetic materials Each chapter will have an introduction and a section to provide a detailed description of the processing method The following sections give detailed descriptions of the processing properties and applications of the relevant materials Finally the potential and limitation of the processing method will be discussed The properties of a magnetic material can be characterized by intrinsic properties such as anisotropy saturation magnetization and extrinsic properties such as coercivity The properties of a magnetic material can be affected by its chemical composition and processing route With the continuous search for new materials and invention of new processing routes magnetic properties of materials cover a wide spectrum of soft magnetic materials hard magnetic materials recording materials sensor materials and others The objective of the fourth volume Properties and Applications of Advanced Magnetic Materials is to provide a comprehensive review of recent development of various magnetic materials and their applications Each chapter will have an introduction of the materials and the principles of their applications The following sections give a detailed description of the processing properties and applications Finally the potential and limitation of the materials will be discussed

Handbook of Materials Science, Volume 2 Raghumani S. Ningthoujam, A. K. Tyagi, 2024-08-15 This book presents state of the art coverage of the basic concepts of magnetization The book focuses on electron spin interaction electron spin magnetic field interactions with or without angular dependent magnetic properties with the dimension of particles or surrounding environment proximity effects on core shell structure or hybrid or composite and their applications It also discusses recent advances in magnetic materials and its future scope This book is of interest to students researchers and professionals working in the area of materials science especially magnetic materials and allied fields

Handbook of Magnetic Materials, 1999-11-19 This volume is composed of topical review articles written by leading authorities in the field As in previous volumes in the series each article presents an extensive description in graphical as well as in tabular form placing emphasis on the discussion of the experimental material in the framework of physics chemistry and material science Chapter one focuses on GMR in magnetic multilayers spin valves multilayers on grooved substrates and multilayered nanowires Furthermore it comprises theoretical models and employs the experimental data to discuss the current understanding of GMR and the underlying physics A key aspect of the study of the properties of thin magnetic films and multilayers is the relationship between the structural and magnetic properties of the material which has become one of the most active areas of research in magnetism in recent years NMR is a well known technique that offers the possibility to obtain experimental information on atomic scale properties in systems with reduced dimensionality Chapter two reviews the results obtained by NMR on the latter systems Written in tutorial style it will be helpful to scientists familiar with the preparation and properties of thin magnetic films but having little knowledge of the NMR of ferromagnetic materials Chapter three examines rare earth compounds with 3d transition metals in particular those that exhibit a magnetic instability of the 3d subsystem It focuses on such compounds in which the d electron subsystem is neither non magnetic nor carries a stable magnetic moment The last chapter is concerned with the promising technology of magnetic refrigeration which can be used in a broad range of applications It is based on the magnetocaloric effect associated with the entropy change occurring when a magnetic material is isothermally subjected to a changing magnetic field and the temperature change when the field is changed adiabatically The last decade has witnessed quite a strong development in magnetic cooling technology and research activities in this field have been extended to a variety of magnetocaloric materials including amorphous alloys nanocomposites intermetallic compounds and perovskite type oxides The many materials their magnetocaloric efficiency as well as the physical principles behind it are reviewed in this final chapter
