**Hematopoietic Stem Cell Transplantation Research Advances** Karl B. Neumann, 2008 Hematopoietic stem cell transplantation HSCT is the transplantation of blood stem cells derived from the bone marrow that is bone marrow transplantation or blood Stem cell transplantation is a medical procedure in the fields of haematology and oncology most often performed for people with diseases of the blood bone marrow or certain types of cancer Stem cell transplantation was pioneered using bone marrow derived stem cells by a team at the Fred Hutchinson Cancer Research Center from the 1950s through the 1970s led by E Donnall Thomas whose work was later recognised with a Nobel Prize in Physiology and Medicine Thomas work showed that

bone marrow cells infused intravenously could repopulate the bone marrow and produce new blood cells His work also reduced the likelihood of developing a life threatening complication called Graft versus host disease With the availability of the stem cell growth factors GM-CSF and G-CSF most hematopoietic stem cell transplantation procedures are now performed using stem cells collected from the peripheral blood rather than from the bone marrow Collecting stem cells provides a bigger graft and does not require that the donor be subjected to general anaesthesia to collect the graft Hematopoietic stem cell transplantation remains a risky procedure with many possible complications it has always been reserved for patients with life threatening diseases This book presents recent leading research in the field
