Free Convection Film Flows and Heat Transfer De-Yi Shang, 2010-02-12 This book presents recent developments in systematic studies of hydrodynamics and heat and mass transfer in laminar free convection accelerating film boiling and condensation of Newtonian fluids as well as accelerating film flow of non Newtonian power law fluids FFNF A novel system of analysis models is provided with a developed velocity component method instead of traditional Falkner Skan type transformation and a system of models for treatment of variable thermophysical properties is presented with an innovative temperature parameter method that makes it easier to similarly treat related governing differential equations for consideration of fluid variable thermophysical properties A pseudo similarity method is applied for

dealing with thermal boundary layer of FFNF furthermore with an induced local Prandtl number which greatly simplifies the heat transfer analysis and numerical calculation Based on rigorous theoretical analyses a system of numerical solutions is formulated by special curve fitting approaches for simple and reliable predictions of heat and mass transfer and hydrodynamics In view of a shortage of experimental results for velocity field of free convection boundary layer recent rigorous experimental measurements are presented covering large temperature differences

Convective Heat and Mass Transfer in Porous Media Sadik Kakaç, Birol Kilkis, Frank A. Kulacki, Faruk Annç, 2012-12-06 The rapid growth of literature on convective heat and mass transfer through porous media has brought both engineering and fundamental knowledge to a new state of completeness and depth Additionally several new questions of fundamental merit have arisen in several areas which bear direct relation to further advancement of basic knowledge and applications in this field For example the growth of fundamental heat transfer data and correlations for engineering use for saturated media has now reached the point where the relations for heat transfer coefficients and flow parameters are known well enough for design purposes Multiple flow field regimes in natural convection have been identified in several important enclosure geometries New questions have arisen on the nature of equations being used in theoretical studies i e the Validity of Darcy assumption is being brought into question Wall effects in high and low velocity flow fields have been found to play a role in predicting transport coefficients The formulation of transport problems in fractured media are being investigated as both an extension of those in a homogeneous medium and for application in engineering systems in geologic media and problems on saturated media are being addressed to determine their proper formulation and solution The long standing problem of how to adequately formulate and solve problems of multi phase heat and mass transfer in heterogeneous media is important in the technologies of chemical reactor engineering and enhanced oil recovery

Cold Inflow-Free Solar Chimney Md. Mizanur Rahman, Chi-Ming Chu, 2021-05-28 This book highlights the design of a new type of solar chimney that has lower height and bigger diameter and discusses its applications The bigger diameter chimneys are introduced showing cold inflow phenomena that significantly reduced the performance of solar chimney The cold inflow free operation of solar chimneys restores the draft losses and enhances the performance of the solar chimneys Numerical and experimental investigation results will be presented to highlight the performance of cold inflow free solar chimney performance In addition this book covers the important basic design parameters that affect the design of solar chimney for different applications mainly solar chimney assisted ventilation for passive cooling and power generation system
