Multifield Problems A.-M. Sändig, W. Schiehlen, W.L. Wendland, 2013-06-29 The simulation of complex engineering problems often involves an interaction or coupling of individual phenomena which are traditionally related by themselves to separate fields of applied mechanics Typical examples of these so called multifield problems are the thermo mechanical analysis of solids with coupling between mechanical stress analysis and thermal heat transfer processes the simulation of coupled deformation and fluid transport mechanisms in porous media the prediction of mass transport and phase transition phenomena of mixtures the analysis of sedimentation processes based on an interaction of particle dynamics and viscous flow

the simulation of multibody systems and fluid structure interactions based on solid to solid and solid to fluid contact mechanisms

Analysis and Simulation of Multifield Problems Wolfgang L. Wendland, Messoud Efendiev, 2012-11-10

The analysis and simulation of multifield problems have recently become one of the most actual and vivid areas of research. Although the individual subproblems of complex technical and physical phenomena often are understood separately, their interaction and coupling create not only new difficulties but also a complete new level and quality of interacting coupled field problems. Presented by leading experts, this book includes recent results in these fields from the International Conference on Multifield Problems, April 8-10, 2002, at the University of Stuttgart, Germany.

Structure-preserving space-time discretization in a mixed framework for multi-field problems in large strain elasticity Janz, Alexander, 2019-07-31

Consistent Higher Order Accurate Time Discretization Methods for Inelastic Material Models Schröder, Bettina Anna Barbara, 2020-01-20

The present thesis investigates the usage of higher order accurate time integrators together with appropriate error estimators for small and finite dynamic visco plasticity. Therefore, a general visco plastic problem is defined which serves as a basis to create closed form solution strategies. A classical access towards small and finite visco plasticity is integrated into this concept. This approach is based on the idea that the balance of linear momentum is formulated in a weak sense and the material laws are included indirectly. Thus, separate time discretizations are implemented and an appropriate coupling between them is necessary. Limitations for the usage of time integrators are the consequence. In contrast, an alternative multifield formulation is derived, adapting the principle of Jourdain. The idea is to assume that the balance of energy, taking into account a pseudopotential representing dissipative effects, resembles a rate type functional whose stationarity condition leads to the equations describing small or finite dynamic visco plasticity. Accordingly, the material laws and the balance of linear momentum can be solved on the same level and only one single time discretization has to be performed. A greater freedom in the choice of time integrators is obtained and the application of higher order accurate schemes such as Newmark's method, fully implicit as well as diagonally implicit Runge-Kutta schemes and continuous as well as discontinuous Galerkin methods is facilitated. An analysis and a comparison of the classical and the multifield formulation is accomplished by means of distinct examples. In this context, a dynamic benchmark problem is developed which allows to focus on the effect of different time integrators. For this investigation, a variety of time discretization error estimators are formulated, evaluated, and compared.
