Synthesis and Analytics of Rigidified Peptide Architectures. Neuropeptide Y Dipeptide Scan Ring-Chain-Equilibria of Imino peptides Thiazole Amino Acids for Thiopeptide Antibiotics Sebastian Enck, 2010 The architectures three dimensional shapes of peptides determine their respective biological functions Therefore the correct alignment of functionalities in a structure by constraining the flexibility is a key process in evolution as well as in medicinal chemistry in order to increase binding affinity and selectivity The rigidification of a peptide chain can have local effects incorporation of the amino acid proline or it can globally restrain flexibility macrocyclization Furthermore the combination of both strategies has given rise to complex antibiotics with highly optimized modes of action This work approaches these principles in three topics and for different purposes The first chapter presents a novel scanning strategy which utilizes synthetic local rigidifications for the evaluation of Neuropeptide Y structure and receptor binding patterns The fundamental process of macrocyclization is topic of the second chapter For imino peptides ring chain equilibria can be established and controlled thereby allowing for the thermodynamic analysis of the ring closure This leads to the identification of structural determinants that influence the inclination of a peptide chain to close the ring In the third chapter a sugar based synthetic pathway leading to highly functionalized thiazole dipeptides is described This strategy led to the synthesis of core motifs of complex thiopeptide antibiotics as well as to diastereomers and homologs thereof
