A situation very close to that which has just been described occurs when the starting of a motor is aborted and the circuit breaker or contactor interrupts the starting current. The motor, at rest, behaves like a three-phase reactor with its neutral isolated. An oscillogram for such a switching operation is presented in Fig. 6.6. Phase A is seen to interrupt first, creating clearly discernable discontinuities in the currents of the other two phases, which now become equal and opposite. Simultaneous interruption of the currents in phases B and C occurs 90° later; note the lower recovery voltages experienced by poles B and C of the breaker compared with that of phase A . Note, also, that these are equal and opposite.
