- The Final Exam covers all course material from Lessons
- Do Practice Final Exam for extra practice and extra credit.
- Review all other test reviews given during the semester.
- Do the teacher evaluations in CASA for an extra 5 points extra credit on the Final Exam.
- If the Final Exam raw score is better than your lowest regular raw test grade, it will replace it.
- The downloaded version of GGB (not the web version) will be a link on the CASA. Testing computers.
- The following formulas will be provided on the Final Exam CASA Testing Center computers as a link.

$$\frac{f(x+h)-f(x)}{h} = \frac{f(b)-f(a)}{b-a}$$

$$C(x) = cx + F$$

$$R(x) = sx$$
 or $R(x) = xp$

$$P(x) = R(x) - C(x)$$

$$\overline{C(x)} = \frac{C(x)}{x}$$

$$E(p) = -\frac{p \cdot f'(p)}{f(p)}$$

$$CS = \int_{0}^{Q_E} D(x) dx - Q_E \cdot P_E$$

$$PS = Q_x \cdot P_x - \int_a^{Q_x} S(x) dx$$

$$\frac{1}{b-a}\int_a^b f(x)dx$$

$$D(x, y) = f_{xx}f_{yy} - (f_{xy})^2$$

- If D(a, b) > 0 and $f_{ss}(a, b) < 0$, then f has a relative maximum at (a, b). If D(a, b) > 0 and $f_{ss}(a, b) > 0$ then f has a relative minimum at (a, b).
- If D(a, b) < 0, then f has neither a relative maximum nor a relative minimum at (a, b) (i.e., it has a saddle point, which is neither a max nor a min).
- If D(a, b) = 0, then this test is inconclusive.

Features of p Laplace Phase Transitions E Valdinoci Readership Applied mathematicians and researchers in analysis and differential equations Fundamentals of Mechanical Vibrations Liang-Wu Cai, 2016-04-25 This introductory book covers the most fundamental aspects of linear vibration analysis for mechanical engineering students and engineers Consisting of five major topics each has its own chapter and is aligned with five major objectives of the book It starts from a concise rigorous and yet accessible introduction to Lagrangian dynamics as a tool for obtaining the governing equation s for a system the starting point of vibration analysis The second topic introduces mathematical tools for vibration analyses for single degree of freedom systems In the process every example includes a section Exploring the Solution with MATLAB This is intended to develop student's affinity to symbolic calculations and to encourage curiosity driven explorations. The third topic introduces the lumped parameter modeling to convert simple engineering structures into models of equivalent masses and springs The fourth topic introduces mathematical tools for general multiple degrees of freedom systems with many examples suitable for hand calculation and a few computer aided examples that bridges the lumped parameter models and continuous systems The last topic introduces the finite element method as a jumping point for students to understand the theory and the use of commercial software for vibration analysis of real world structures **State Estimation for** Nonlinear Continuous-Discrete Stochastic Systems Gennady Yu. Kulikov, Maria V. Kulikova, 2024-09-06 This book addresses the problem of accurate state estimation in nonlinear continuous time stochastic models with additive noise and discrete measurements Its main focus is on numerical aspects of computation of the expectation and covariance in Kalman like filters rather than on statistical properties determining a model of the system state Nevertheless it provides the sound theoretical background and covers all contemporary state estimation techniques beginning at the celebrated Kalman filter including its versions extended to nonlinear stochastic models and till the most advanced universal Gaussian filters with deterministically sampled mean and covariance In particular the authors demonstrate that when applying such filtering procedures to stochastic models with strong nonlinearities the use of adaptive ordinary differential equation solvers with automatic local and global error control facilities allows the discretization error and consequently the state estimation error to be reduced considerably For achieving that the variable stepsize methods with automatic error regulation and stepsize selection mechanisms are applied to treating moment differential equations arisen The implemented discretization error reduction makes the self adaptive nonlinear Gaussian filtering algorithms more suitable for application and leads to the novel notion of accurate state estimation. The book also discusses accurate state estimation in mathematical models with sparse measurements Of special interest in this regard it provides a means for treating stiff stochastic systems which often encountered in applied science and engineering being exemplified by the Van der Pol oscillator in electrical engineering and the Oregonator model of chemical kinetics Square root implementations of all Kalman like filters considered and explored in this book for state estimation in Ill conditioned continuous discrete stochastic systems attract the authors particular attention This book covers both theoretical and applied aspects of numerical integration methods including the concepts of approximation convergence stiffness as well as of local and global errors suitably for applied scientists and engineers Such methods serve as a basis for the development of accurate continuous discrete extended unscented cubature and many other Kalman filtering algorithms including the universal Gaussian methods with deterministically sampled expectation and covariance as well as their mixed type versions. The state estimation procedures in this book are presented in the fashion of complete pseudo codes which are ready for implementation and use in MATLAB or in any other computation platform. These are examined numerically and shown to outperform traditional variants of the Kalman like filters in practical prediction filtering tasks including state estimations of stiff and or ill conditioned continuous discrete nonlinear stochastic systems
