The Management of Uncertainty: Approaches, Methods and Applications Luc Wilkin, A.

Sutton, 2012-12-06 For thirty years the literature on decision making and planning has been divided into two camps work premised on rational models of choice and work designed to discredit such models The sustained critic of fully rational decision making theories has already a long history and a constant message to deliver in practice consequential decision making hardly fulfills the canons of perfect rationality There is also evidence that decision making and planning are not unitary processes Although the concept of decision making connotes the idea of a single process making a single choice involves a complex of processing tasks structuring the problem finding alternatives worth considering deciding what information is relevant assessing various consequences and a variety of others The aim of this volume is to bring together and try to inter relate some of the concepts and relevant knowledge from various disciplines concerned with one important aspect of this complex process the management of uncertainty It is hardly necessary to reiterate the case made by numerous authors about our changing and increasingly uncertain world Suffice it to say here that it is uncertainty about the future and in many cases about the past and the present also which makes decision making and planning so difficult The management of uncertainty may be defined as the way in which uncertainty is treated and processed in decision making

Undergraduate Catalog University of Michigan--Dearborn,2006 **DATAFRAME MANIPULATION: THEORY AND APPLICATIONS WITH PYTHON AND TKINTER** Vivian Siahaan,Rismon Hasiholan Sianipar,2024-08-13 A DataFrame is a fundamental data structure in pandas a powerful Python library for data manipulation and analysis designed to handle two dimensional labeled data akin to a spreadsheet or SQL table It simplifies working with tabular data by supporting various operations like filtering sorting grouping and aggregating DataFrames are easily created from lists dictionaries or NumPy arrays and offer flexible data handling including managing missing values and performing input output operations with different file formats Key features include hierarchical indexing for multi level grouping time series functionality and integration with libraries such as NumPy and Matplotlib DataFrame manipulation encompasses filtering sorting merging grouping pivoting and reshaping data while also allowing custom functions handling missing data and managing data types Mastering these techniques is crucial for efficient data analysis ensuring clean transformed data ready for deeper insights and decision making In chapter 2 in the first project we filter a DataFrame named employee_data which includes columns like Name Department Age Salary and Years_Worked to find employees in the Engineering department with a salary exceeding 70 000 We create the DataFrame using sample data and apply boolean indexing to achieve this The boolean masks employee_data Department Engineering and employee_data Salary 70000 identify rows meeting each condition Combining these masks with the operator filters the DataFrame to include only those rows where both conditions are met resulting in a subset of employees who fit the criteria The final output displays this filtered DataFrame In second project we filter a DataFrame named sales_data which includes columns such as Product Category Quantity Sold Unit Price and Total Revenue to find products in the Electronics category with quantities sold exceeding 100 We use boolean indexing to achieve this sales_data Category Electronics creates a mask for rows in the Electronics category while sales_data Quantity_Sold 100 identifies rows where quantities sold are above 100 By combining these masks with the operator we filter the DataFrame to include only rows meeting both conditions The final output displays this filtered subset of products In third project we filter a DataFrame named movie_data which includes columns such as Title Genre Release Year Rating and Box Office Earnings to find movies released after 2010 with a rating above 8 We use boolean indexing where movie_data Release_Year 2010 creates a mask for movies released after 2010 and movie_data Rating 8 identifies movies with ratings higher than 8 By combining these masks with the operator we filter the DataFrame to include only the rows meeting both conditions The final output displays the subset of movies that fit these criteria The fourth project demonstrates a Tkinter based GUI application for

filtering a sales dataset using Python libraries Tkinter Pandas and PandasTable The application allows users to interact with a table displaying sales data applying filters based on product category and quantity sold The filter_data function updates the table to show only items from the selected category with quantities exceeding the specified value while the refresh_data function resets the table to display the original dataset The GUI includes input fields for category selection and quantity entry along with buttons for filtering and refreshing The sales data is initially presented in a PandasTable with a toolbar and status bar Users interact with the interface which updates and displays filtered data or the full dataset as needed The fifth project features a Tkinter GUI application that lets users filter a movie dataset by minimum release year and rating using Python libraries Tkinter Pandas and PandasTable The filter_data function updates the displayed table based on user inputs while the refresh_data function resets it to show the original dataset The GUI includes fields for entering minimum release year and rating buttons for filtering and refreshing and a PandasTable for displaying the data The application allows for interactive data filtering and visualization with the table initially populated with sample movie data In the sixth project a retail store manager uses a DataFrame containing sales data to identify products that are both popular and profitable By applying logical operators to filter the DataFrame the goal is to isolate products that have sold more than 100 units and generated revenue exceeding 5000 This filtering is achieved using the Pandas library in Python where the operator combines conditions to select the relevant rows The resulting DataFrame which includes only products meeting both criteria provides insights for decision making and analysis in retail management The seventh project involves creating a Tkinter based GUI application to manage and visualize sales data The GUI displays data in a table and a bar graph allowing users to filter products based on minimum quantity sold and total revenue The application uses pandas for data manipulation pandastable for table display and matplotlib for the bar graph The GUI consists of an input frame for user filters and a display frame for showing the table and graph side by side Users can update the table and graph by clicking Filter Data or reset them to the original data with the Refresh button providing an interactive way to analyze sales performance In chapter three the first project demonstrates how to sort synthetic financial data for analysis The code imports libraries sets random seeds for reproducibility and generates data for businesses including revenue and expenses It then creates a DataFrame with this data sorts it by monthly revenue in descending order and saves the sorted DataFrame to an Excel file This process aids in organizing and analyzing financial data making it easier to identify top performing businesses The second project creates a Tkinter GUI to view and interact with synthetic financial data displaying monthly revenue and expenses for various businesses It generates random data stores it in a DataFrame and sets up a GUI with two tabs one for sorting by revenue and another for expenses Each tab features a table to display the data and a matplotlib plot for visual representation The GUI allows users to sort and view data dynamically with alternating row colors for readability and embedded plots for better analysis The third project generates synthetic unemployment data for 10 regions over 5 years sets random seeds for

reproducibility and creates a DataFrame with the data. It then sorts the DataFrame alphabetically by region and saves it to an Excel file named `synthetic_unemployment_data.xlsx`. Finally, the script prints a confirmation message indicating that the data has been successfully saved.

The fourth project generates synthetic unemployment data for 25 regions over a 5-year period and creates a Tkinter GUI for interactive data exploration. The data is organized into a DataFrame and saved to an Excel file. It is displayed in a tabbed interface with two views: one sorted by unemployment rate and another by year. Each tab features scrollable tables and corresponding bar charts for visual analysis. The `UnemploymentDataGUI` class manages the interface, updating tables and graphs dynamically to allow users to explore regional and yearly unemployment variations effectively.

The fifth project demonstrates how to concatenate dataframes with synthetic temperature data for various countries. Initially, we generate temperature data for countries like the USA and Canada for each month. Next, we create an additional dataframe with temperature data for other countries such as the UK and Germany. We then concatenate the original and additional dataframes into a single dataframe and save the combined data to an Excel file named `combined_temperatures.xlsx`. The steps involve generating synthetic data, creating additional dataframes, concatenating them, and exporting the result to Excel.

The sixth project demonstrates how to build a Tkinter application to visualize synthetic temperature data. The app features a tabbed interface with tabs for displaying raw data, temperature graphs, and filters. It uses alternating row colors for better readability and includes functionality for filtering data by country and month. Users can view and analyze temperature data across different countries through tables and graphical representations and apply or reset filters as needed.

The seventh project demonstrates how to perform an inner join on two synthetic dataframes: one containing housing details and the other containing owner information. First, synthetic data is generated for houses and their owners. The dataframes are then merged on the common key `HouseID` using an inner join to include only rows with matching keys. Finally, the combined data is saved to an Excel file named `combined_housing_data.xlsx`. The result is an Excel file that contains details about houses along with their respective owners.

The eighth project provides an interactive platform for managing and visualizing synthetic housing data. Users can view comprehensive tables, apply filters for location and house type, and analyze house price distributions with Matplotlib plots. The application includes tabs for displaying data, filtering results, and generating visualizations, with functionalities to reset filters, save filtered data to Excel, and ensure a user-friendly experience with alternating row colors in tables and dynamic updates.

To demonstrate an outer join on DataFrames with synthetic medical data in the ninth project, we create two DataFrames: one for patient information and another for medical records. We then perform an outer join to ensure all patients and records are included, even if some records don't have corresponding patient data. The code generates synthetic data, performs the outer join using `pd.merge` on the `PatientID` column, and saves the result to an Excel file named `outer_join_medical_data.xlsx`. This approach provides a comprehensive dataset with complete patient and medical record information.

The tenth project involves creating a Tkinter-based desktop application to visualize and interact with synthetic

medical data The application uses an outer join to merge patient and medical record datasets displaying the comprehensive result in a user friendly table Users can filter data by patient ID and condition view distribution graphs of medical conditions and save filtered results to an Excel file The GUI leveraging Tkinter and Matplotlib includes tabs for data display filtering and graph visualization providing a robust tool for exploring medical datasets In chapter four the first project demonstrates creating and manipulating a synthetic insurance dataset Using numpy and pandas the script generates random data including columns for Policyholder Age State Coverage_Type and Premium It groups this data by State and Coverage_Type to show basic data segmentation then saves the dataset to an Excel file for further analysis The code provides a practical framework for simulating and analyzing insurance data by illustrating the process of data creation grouping and storage The second project demonstrates a Tkinter GUI application designed for analyzing a synthetic insurance dataset The GUI displays 1 000 records of policyholder data in a scrollable table using the Treeview widget with options to filter by state and coverage type Users can save filtered data to an Excel file and generate a bar plot of policy distribution by state integrated into the Tkinter window using Matplotlib This application provides interactive tools for data exploration filtering exporting and visualization in a user friendly interface The third project focuses on creating analyzing and aggregating a large synthetic sales dataset with 10 000 records This dataset includes salespersons regions products sales amounts and timestamps simulating a detailed sales environment The core task involves grouping the data by region product and salesperson to calculate total sales and transaction counts This aggregated data is saved to an Excel file providing insights into sales performance and trends which helps businesses optimize their sales strategies and make informed decisions The fourth project develops a Tkinter GUI for analyzing synthetic sales data allowing users to explore raw and aggregated data interactively The application includes a dual view setup with raw and aggregated data tables filtering options for region product and salesperson and visualization features for generating plots Users can apply filters view data summaries save results to Excel and visualize sales trends by region The GUI is designed to provide a comprehensive tool for data analysis visualization and reporting The dataset includes 10 000 records with attributes such as salesperson region product sales amount and date and is grouped by region product and salesperson to aggregate sales data The fifth project demonstrates how to create and analyze a synthetic transportation dataset The code generates a large dataset simulating vehicle and route data including distances traveled and durations It groups the data by vehicle and route calculating total and average distances and durations and then saves these aggregated results to an Excel file This approach allows for detailed examination of transportation patterns and performance metrics facilitating reporting and decision making The sixth project outlines a Tkinter GUI project for analyzing synthetic transportation data using Python This GUI combining Tkinter and Matplotlib provides a user friendly interface to inspect and visualize large datasets involving vehicle routes distances and durations It features interactive tables for raw and aggregated data filter options for vehicle route and date and integrates

various plots like histograms and bar charts for data visualization Users can apply filters view dynamic updates and save filtered data to Excel The goal is to facilitate comprehensive data analysis and enhance decision making through an intuitive interactive tool In chapter five the first project involves generating and analyzing a synthetic dataset representing gold production across countries years and regions The dataset created with attributes like country year region and production quantities simulates complex real world data for detailed analysis By using the `pivot_table` method the data is transformed to aggregate gold production metrics by country and region over different years revealing trends and patterns The results are saved as both original and pivoted datasets in Excel files for easy access and further analysis aiding in decision making related to mining and resource management The second project creates an interactive Tkinter GUI to visualize and interact with a large synthetic dataset on gold production including details on countries regions mines and yearly production Using pandas and numpy to generate the dataset the GUI features multiple tabs for viewing the original data pivoted data and various summary statistics alongside graphical visualizations of gold production trends across countries regions and years The application integrates matplotlib for embedding charts within the Tkinter interface making it a comprehensive tool for exploring and analyzing the data effectively The third project demonstrates how to create a synthetic dataset simulating stock prices for multiple companies over 10 000 days using random number generation to simulate stock prices for AAPL GOOG AMZN MSFT TSLA and META The dataset initially in a wide format with separate columns for each company's stock prices is then reshaped to a long format using `pd.melt` This long format where each row represents a single date stock and its price is often better suited for data analysis and visualization Finally both the original and unpivoted DataFrames are saved to separate Excel files for further use The fourth project involves developing a visually engaging Tkinter GUI to analyze and visualize a synthetic stock dataset The application handles stock price data for multiple companies offering users both the original and unpivoted DataFrames along with summary statistics and graphical representations The GUI includes tabs for viewing raw and transformed data statistical summaries and interactive graphs utilizing Tkinter's advanced widgets for a polished user experience Data is saved to Excel files and Matplotlib charts are integrated for clear data visualization making the tool useful for both casual and advanced analysis of stock market trends In chapter six the first project demonstrates creating a large synthetic road traffic dataset with 10 000 rows using randomization techniques Fields include Date Time Location Vehicle_Count Average_Speed and Incident Random NaN values are introduced into 10% of the dataset to simulate missing data The dataset is then cleaned by removing rows with any missing values using `dropna` and the resulting cleaned DataFrame is saved to `cleaned_large_road_traffic_data.xlsx` for further analysis The second project creates a Tkinter based GUI to analyze and visualize a synthetic road traffic dataset It generates a dataset with 10 000 rows including fields like date time location vehicle count average speed and incidents Random missing values are introduced and then removed by dropping rows with any NaNs The GUI features four tabs one for the original dataset one for the cleaned dataset one for
