Mathematical Analysis Of Urban Spatial Networks Understanding Complex Systems:

Mathematical Analysis of Urban Spatial Networks Philippe Blanchard, Dimitri Volchenkov, 2008-10-23 Cities can be considered to be among the largest and most complex artificial networks created by human beings. Due to the numerous and diverse human driven activities, urban network topology and dynamics can differ quite substantially from that of natural networks and so call for an alternative method of analysis. The intent of the present monograph is to lay down the theoretical foundations for studying the topology of compact urban patterns using methods from spectral graph theory and statistical physics. These methods are demonstrated as tools to investigate the structure of a number of real cities with widely differing properties: medieval German cities, the webs of city canals in Amsterdam and Venice and a modern urban structure such as found in Manhattan. Last but not least, the book concludes by providing a brief overview of possible applications that will eventually lead to a useful body of knowledge for architects, urban planners and civil engineers.

The Mathematics of Urban Morphology Luca D'Acci, 2019-03-23 This edited volume provides an essential resource for urban morphology: the study of urban forms and structures offering a much needed mathematical perspective. Experts on a variety of mathematical modeling techniques provide new insights into specific aspects of the field such as street networks, sustainability and urban growth. The chapters collected here make a clear case for the importance of tools and methods to understand, model and simulate the formation and evolution of cities. The chapters cover a wide variety of topics in urban morphology and are conveniently organized by their mathematical principles. The first part covers fractals and focuses on how self-similar structures sort themselves out through competition. This is followed by a section on cellular automata and includes chapters exploring how they generate fractal forms. Networks are the focus of the third part which includes street networks and other forms as well. Chapters that examine complexity and its relation to urban structures are in part four. The fifth part introduces a variety of other quantitative models that can be used to study urban morphology. In the book's final section, a series of multidisciplinary commentaries offers readers new ways of looking at the relationship between mathematics and urban forms. Being the first book on this topic, *Mathematics of Urban Morphology* will be an invaluable resource for applied mathematicians and anyone studying urban morphology. Additionally, anyone who is interested in cities from the angle of economics, sociology, architecture or geography will also find it useful. This book provides a useful perspective on the state of the art with respect to urban morphology in general and mathematics as tools and frames to disentangle the ideas that pervade arguments about form and function in particular. There is much to absorb in the pages that follow and there are many pointers to ways in which these ideas can be linked to related theories of cities, urban design and urban policy analysis as well as new movements such as the role of computation in cities and the idea of the smart city. Much food for thought. Read on, digest, enjoy.
