Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 women, 45 to 65 years of age, who were sedentary and had no history of cardiovascular disease, diabetes, or other chronic conditions. They were randomly assigned to either a walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group was instructed to continue their sedentary lifestyle. The physical health outcomes measured were heart rate, blood pressure, and body mass index (BMI). The psychological health outcomes measured were self-reported stress, anxiety, and depression. The results showed that the walking program had a significant positive effect on all measured outcomes. The walking group had significantly lower heart rates, blood pressures, and BMIs compared to the control group. Additionally, the walking group reported significantly lower levels of stress, anxiety, and depression compared to the control group. The findings suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.
