Apolipoproteins in Lipid Disorders Maryvonne Rosseneu,Kurt

Widhalm, Jochen Jarausch, 2012-12-06 There is increasing evidence for the clinical value of the apo lipoprotein measurements. Besides cholesterol in plasma and lipoprotein fractions which is currently used as an indicator of cardiovascular risk, the measurement of the AI and B apolipoproteins can provide additional information about the patient's clinical status. Several studies show that apo B is higher and apo AI is lower in patients with angiographically documented coronary heart disease than in symptomatic patients without coronary heart disease. Moreover, discriminant analysis indicated that the concentration of Apo AI and B in plasma are better discriminators than lipoprotein cholesterol for identifying patients with coronary heart disease. In some studies, the apo B/apo AI ratio appears to be a more powerful predictor than individual lipoproteins. In a recent study carried out in men, apolipoproteins AI and B were better correlated with the severity of cardiovascular disease than HDL and LDL cholesterol. The predictive power of apolipoproteins could, however, not be demonstrated in all studies, and the value of apolipoprotein measurements in the field of clinical chemistry is still controversial. This is probably due to discrepancies between the results of various studies arising from differences in the type of immunoassays, the lack of universal reference materials, differences between study protocols, variations in the selection of patients and in the grading and interpretation of coronary lesions.
