Description in English: The security of all IT systems is a crucial element that any administrator must assume as one of their main objectives. The large number of services that are offered through networks and the Internet has made it crucially important to shield systems against the different attacks by hackers. Given this problem, the administrator must be prepared to face any attack that may compromise the security of the system. To find a solution to this conflict, the administrator must step into the shoes of a hacker and analyze how system security can be exploited. But is an administrator a hacker? Both roles have extensive computer skills and they analyze companies' security to prevent failures. But the difference lies in their ethics and professionalism. While a hacker examines a computer system for dubious purposes (economic revenge, fun, etc.), an administrator does it to protect the system against possible hacker attacks. The second edition of the book is presented as an updated edition where you will learn the techniques used to find and check for security flaws in a system. computer.
