

LABORATORY EXERCISE #3. Detection of genetically modified food products by gel electrophoresis

Introduction

PCR products of differing lengths can be separated from each other based on size by an analytical method called gel electrophoresis. In this method charged macromolecules (such as DNA, RNA or proteins) migrate through a porous gel typically made from agarose (polysaccharide polymer derived from sea weed) or polyacrylamide when an electrical current is applied. The DNA sample is loaded into a well within the gel and placed near the anode (negative charge). As DNA has a very high negative charge due to the presence of the ionized phosphate groups on its backbone, it will migrate away from the negative anode toward the positively charged cathode as electrophoresis takes place. During the migration, smaller DNA fragments will pass through the gel pores more easily and thus migrate through the gel faster. Larger DNA molecules take longer to get through the pores and will migrate slower. The separated DNA "bands" or fragments can be visualized within the gel by staining with **ethidium bromide**. This dye intercalates (inserts) itself into the DNA and will fluoresces under ultraviolet light. In other words, DNA fragments will appear as fluorescent bands in the gel when exposed to UV light (Fig 1).

Concept check: If you compared two DNA fragments, one of 200-base pairs (bp) and the other of 1000 bp, which fragment will appear lower on the gel/have migrated faster?

Q: During gel electrophoresis, DNA is separated based on what two properties?

A: Size and charge

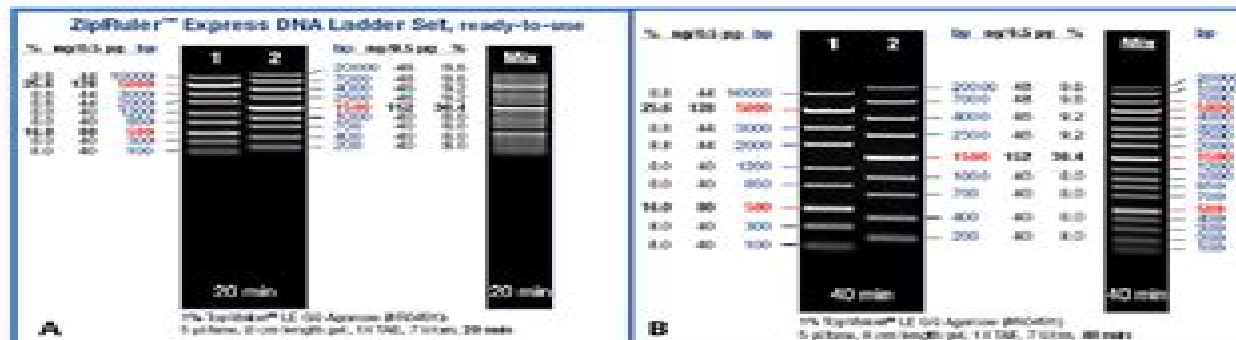

Figure 1. DNA fragments of known size are separated on an agarose gel for 20 min (A) or 40 min (B). By comparing the results, you can see how at 20 min, the DNA fragments are not well separated but by 40 min, the individually sized fragments are well separated and the size is easily determined. each year Blatt also asks us to think about the consequences of eating food so far removed from agriculture why unhealthy food is cheap why there is an International Federation of Competitive Eating what we don't want to know about how animals raised for meat live die and are butchered whether people are even designed to be carnivorous and why there is hunger when food production has increased so dramatically America's Food describes the production of all types of food in the United States and the environmental and health problems associated with each After taking us on a tour of the American food system not only the basic food groups but soil grain farming organic food genetically modified food food processing and diet Blatt reminds us that we aren't powerless Once we know the facts about food in America we can change things by the choices we make as consumers as voters and as ethical human beings

Using Scientific Teaching Principles to Teach Genetic Modification Orion D. Brock,2020 Abstract Genetically modified organisms GMOs are frequently used in genetics based research projects and are now a major part of the food we eat Despite their importance there are many misunderstandings related to what a GMO is and how it is made To help students fully understand the mechanisms of genetic alteration a GMO lab section of Genetics was modified where students were responsible for generating their own theoretical GM crop The lab was also integrated with the relevant lecture material With IRB exemption the approximately 60 students registered into the fall Genetics lab course participated in the experiment The learning outcomes were that the students would understand 1 the genetic mechanisms of constructing a GMO 2 the lab techniques required for making GMOs and 3 the bioethical concerns pertaining to GMOs The Scholarship of Teaching and Learning SoTL is a broad set of principles that employ evidence based learning through research in pedagogy To assess the effectiveness of the altered lab this project used SoTL methodology through a pre and post assessment The backwards design method was used to design the assessments and lab methods around the predetermined learning objectives To measure student learning the pre and post assessments were given two weeks prior to the lab exercise and at the end of the semester As a control half of the lab sections did not have their curriculum modified Results were quantified based on the difference in scores between the assessments Based on the high variability in collected data these specific assessments are shown to be an ineffective measurement of learning Anecdotal feedback from students and from graded labs show that the learning goals were met Future refinement of the assessments is essential to quantifiably determine the success of the modified lab
