Diffraction-Limited Imaging with Very Large Telescopes D.M. Alloin, Jean-Marie Mariotti, 2012-12-06 A few years ago a

real break through happened in observational astronomy the understanding of the effect of atmospheric turbulence on the structure of stellar images and of ways to overcome this dramatic degradation This opened a route to diffraction limited observations with large telescopes in the optical domain Soon the first applications of this new technique led to some outstanding astrophysical results both at visible and infrared wavelengths Yet the potential of interferometric observations is not fully foreseeable as the first long baseline arrays of large optical telescopes are being built or commissioned right now In this respect a comparison with the evolution of radio astronomy is tempting From a situation where in spite of the construction of giant antennas low angular resolution was prevailing the introduction of long baseline and very long baseline interferometry and the rapid mastering of sophisticated image reconstruction techniques have brought on a nearly routine basis high dynamic range images with milliarcseconds resolution This of course has completely changed our views of the radio sky
