

Method for load-flow solution of radial distribution networks

S. Ghosh and D. Das

Abstract: A simple and efficient method for solving radial distribution networks is presented. The proposed method involves only the evaluation of a simple algebraic expression of receiving-end voltages. Computationally, the proposed method is very efficient. The effectiveness of the proposed method is demonstrated through three examples.

1 Introduction

Little attention has been given to load-flow analysis of distribution systems, unlike load-flow analysis of transmission systems. However, some work has been carried out on load-flow analysis of distribution networks, but the choice of a solution method for a practical system is often difficult. Generally, distribution networks are radial and the R/X ratio is very high. For this reason, conventional Newton-Raphson (NR) [1] and fast decoupled load-flow [2] methods do not converge. Many researchers have suggested modified versions of the conventional load-flow methods for solving power networks with high R/X ratio [3–5].

Kersting and Mendive [6] and Kersting [7] have developed a load-flow technique for solving radial distribution networks using ladder-network theory. They have

developed the ladder technique from basic ladder-network theory into a working algorithm, applicable to the solution of radial load-flow problems. Savaris *et al.* [8] have shown that the ladder technique is found to be fastest but did not converge in five out of 12 cases studied. Shirmohammadi *et al.* [9] have proposed a method for solving radial distribution networks based on the direct application of Kirchhoff's voltage and current laws. They have developed a branch-numbering scheme to enhance the numerical performance of the solution method. They have also extended their method for solution of weakly meshed networks. Baran and Wu [10] have obtained the load-flow solution in a distribution system by the iterative solution of three fundamental equations representing real power, reactive power and voltage magnitude. They have computed the system Jacobian matrix using a chain rule. In their method, the mismatches and the Jacobian matrix involve only the evaluation of simple algebraic expressions and no trigonometric functions. They have also proposed decoupled and fast decoupled distribution load-flow algorithms. Chiang [11] has also proposed three different algorithms for solving radial distribution networks based on the method proposed by Baran and Wu [10]. He has proposed decoupled, fast decoupled and very fast decoupled distribution load-flow algorithms. In fact decoupled and fast decoupled distribution load-flow algorithms proposed by Chiang [11] are similar to that of Baran and Wu [10]. However, the very fast decoupled distribution load flow proposed by Chiang [11] is very attractive because it does not require any Jacobian matrix construction and factorisation. Renato [12] has proposed one method for obtaining a load-flow solution of radial distribution networks. He has calculated the electrical equivalent for each node summing all the loads of the network fed through the node including losses and then, starting from the source node, the receiving-end voltages of all the nodes are calculated. Goswami and Basu [13] have presented a direct method for solving radial and meshed distribution networks. However, the main limitation of their method is that no node in the network is the junction of more than three branches, i.e. one incoming and two outgoing branches. Jasson and Lee [14, 15] have proposed a new load-flow method for obtaining the solution of radial distribution networks. They have used the three fundamental equations representing real power, reactive power and voltage magnitude derived in [10]. They have solved the radial distribution network using these three equations by reducing the whole network into a single line equivalent.
