NAME

      intro - introduction to system calls

DESCRIPTION

      Section 2 of the manual describes the Linux system calls. A system
      call is an entry point into the Linux kernel. Usually, system calls
      are not invoked directly: instead, most system calls have corresponding
      C library wrapper functions which perform the steps required (e.g.,
      trapping to kernel mode) in order to invoke the system call. Thus,
      making a system call looks the same as invoking a normal library func-
      tion.

      In many cases, the C library wrapper function does nothing more than:

      * copying arguments and the unique system call number to the registers
         where the kernel expects them;

      * trapping to kernel mode, at which point the kernel does the real
         work of the system call;

      * setting errno if the system call returns an error number when the
         kernel returns the CPU to user mode.

      However, in a few cases, a wrapper function may do rather more than
      this, for example, performing some preprocessing of the arguments
      before trapping to kernel mode, or postprocessing of values returned by
      the system call. Where this is the case, the manual pages in Section 2
      generally try to note the details of both the (usually GNU) C library
      API interface and the raw system call. Most commonly, the main
      DESCRIPTION will focus on the C library interface, and differences for
      the system call are covered in the NOTES section.

      For a list of the Linux system calls, see **syscalls**(2).
