Finite Fields and Applications Dieter Jungnickel, H. Niederreiter, 2001-03-20 This volume represents the refereed proceedings of the Fifth International Conference on Finite Fields and Applications Fq5 held at the University of Augsburg Germany from August 2-6 1999 and hosted by the Department of Mathematics The conference continued a series of biennial international conferences on finite fields following earlier conferences at the University of Nevada at Las Vegas USA in August 1991 and August 1993 the University of Glasgow Scotland in July 1995 and the University of Waterloo Canada in August 1997 The Organizing Committee of Fq5 comprised Thomas Beth University of Karlsruhe Stephen D Cohen University of Glasgow Dieter Jungnickel University of Augsburg Chairman Alfred Menezes University of Waterloo Gary L Mullen Pennsylvania State University Ronald C Mullin University of Waterloo Harald Niederreiter Austrian Academy of Sciences and Alexander Pott University of Magdeburg The program of the conference consisted of four full days and one half day of sessions with 11 invited plenary talks and over 80 contributed talks that required three parallel sessions This documents the steadily increasing interest in finite fields and their applications Finite fields have an inherently fascinating structure and they are important tools in discrete mathematics Their applications range from combinatorial design theory finite geometries and algebraic geometry to coding theory cryptology and scientific computing A particularly fruitful aspect is the interplay between theory and applications which has led to many new perspectives in research on finite fields [A Course in](#)

Algebraic Error-Correcting Codes Simeon Ball, 2020-05-08 This textbook provides a rigorous mathematical perspective on error correcting codes starting with the basics and progressing through to the state of the art Algebraic combinatorial and geometric approaches to coding theory are adopted with the aim of highlighting how coding can have an important real world impact Because it carefully balances both theory and applications this book will be an indispensable resource for readers seeking a timely treatment of error correcting codes Early chapters cover fundamental concepts introducing Shannon's theorem asymptotically good codes and linear codes The book then goes on to cover other types of codes including chapters on cyclic codes maximum distance separable codes LDPC codes p-adic codes amongst others Those undertaking independent study will appreciate the helpful exercises with selected solutions A Course in Algebraic Error Correcting Codes suits an interdisciplinary audience at the Masters level including students of mathematics engineering physics and computer science Advanced undergraduates will find this a useful resource as well An understanding of linear algebra is assumed

Essays on Coding Theory Ian F. Blake, 2024-03-14 Critical coding techniques have developed over the past few decades for data storage retrieval and transmission systems significantly mitigating costs for governments and corporations that maintain server systems containing large amounts of data This book surveys the basic ideas of these coding techniques which tend not to be covered in the graduate curricula including pointers to further reading Written in an informal style it avoids detailed coverage of proofs making it an ideal refresher or brief introduction for students and researchers in academia and industry who may not have the time to commit to understanding them deeply Topics covered include fountain codes designed for large file downloads LDPC and polar codes for error correction network rank metric and subspace codes for the transmission of data through networks post quantum computing and quantum error correction Readers are assumed to have taken basic courses on algebraic coding and information theory

Wallis, John C. George, 2016-12-12 What Is Combinatorics Anyway Broadly speaking combinatorics is the branch of mathematics dealing with different ways of selecting objects from a set or arranging objects It tries to answer two major kinds of questions namely counting questions how many ways can a selection or arrangement be chosen with a particular set of properties and structural questions does there exist a selection or arrangement of objects with a particular set of properties The authors have presented a text for students at all levels of preparation For some this will be the first course where the students see several real proofs Others will have a good background in linear algebra will have completed the calculus stream and will have started abstract algebra The text starts by briefly discussing several examples of typical combinatorial problems to give the reader a better idea of what the subject covers The next chapters explore enumerative ideas and also probability It then moves on to enumerative functions and the relations between them and generating functions and recurrences Important families of functions or numbers and then theorems are presented Brief introductions to computer algebra and group theory come next Structures of particular interest in combinatorics posets graphs codes Latin squares and experimental designs follow The authors conclude with further discussion of the interaction between linear
