Information Security reaches back to ancient times and starts with the emergence of bureaucracy in administration and warfare. Some aspects such as the interception of encrypted messages during World War II have attracted huge attention, whereas other aspects have remained largely uncovered. There has never been any effort to write a comprehensive history. This is most unfortunate because Information Security should be perceived as a set of communicating vessels where technical innovations can make existing legal or organisational frameworks obsolete and a breakdown of political authority may cause an exclusive reliance on technical means. This book is intended as a first field survey. It consists of twenty-eight contributions written by experts in such diverse fields as computer science, law, or history and political science, dealing with episodes, organisations, and technical developments that may be considered to be exemplary or have played a key role in the development of this field. These include the emergence of cryptology as a discipline during the Renaissance, the Black Chambers in 18th-century Europe, the breaking of German military codes during World War II, the histories of the NSA and its Soviet counterparts, and contemporary cryptology. Other subjects are computer security, standards, viruses, and worms on the Internet, computer transparency, and free software, computer crime, export regulations for encryption software, and the privacy debate. Interdisciplinary coverage of the history of Information Security. Written by top experts in law, history, computer, and information science. First comprehensive work in Information Security.
