

The background features a complex system architecture diagram. At the top, a box labeled 'Finite State Machines' contains several state transition diagrams. Below this, a 'Memory' block is connected to a 'Memory Controller' and an 'I/O' block. A central 'CPU' block is connected to these components. To the left, a 'Logic' block is shown. Below the CPU, there are blocks for 'MPEG encoder and decoder', 'Radio', and 'Flash'. On the right, a 'Discrete-Event' block contains a sequence of components: 'PTECH', 'DECON', 'M2AC', 'CODEC', 'MEMORY', and 'LOCAL'. A 'Dataflow' arrow points from the CPU area towards the Discrete-Event block.

Ingredients For Successful System Level Design Methodology:

Ingredients for Successful System Level Design Methodology Hiren D. Patel, Sandeep Kumar Shukla, 2008-06-06 ESL or Electronic System Level is a buzz word these days in the electronic design automation EDA industry in design houses and in the academia Even though numerous trade magazine articles have been written quite a few books have been published that have attempted to define ESL it is still not clear what exactly it entails However what seems clear to every one is that the Register Transfer Level RTL languages are not adequate any more to be the design entry point for today's and tomorrow's complex electronic system design There are multiple reasons for such thoughts First the continued progression of the miniaturization of the silicon technology has led to the ability of putting almost a billion transistors on a single chip Second applications are becoming more and more complex and integrated with communication control ubiquitous and pervasive computing and hence the need for ever faster ever more reliable and more robust electronic systems is putting designers towards a productivity demand that is not sustainable without a fundamental change in the design methodologies Also the hardware and software functionalities are getting interchangeable and ability to model and design both in the same manner is gaining importance Given this context we assume that any methodology that allows us to model an entire electronic system from a system perspective rather than just hardware with discrete event or cycle based semantics is an ESL methodology of some kind Metamodeling-driven IP Reuse for SoC Integration and Microprocessor Design Deepak A.

Mathaikutty, Sandeep Shukla, 2009 This cutting edge resource offers you an in depth understanding of metamodeling approaches for the reuse of intellectual properties IPs in the form of reusable design or verification components The book covers the essential issues associated with fast and effective integration of reusable design components into a system on a chip SoC to achieve faster design turn around time Moreover it addresses key factors related to the use of reusable verification IPs for a write once use many times verification strategy another effective approach that can attain a faster product design cycle Multi-disciplinary Trends in Artificial Intelligence Antonis Bikakis, Xianghan Zheng, 2015-11-28 This book constitutes the refereed conference proceedings of the 9th International Conference on Multi disciplinary Trends in Artificial Intelligence MIWAI 2015 held in Fuzhou China in November 2015 The 30 revised full papers presented together with 12 short papers were carefully reviewed and selected from 83 submissions The papers feature a wide range of topics covering knowledge representation reasoning and management multi agent systems data mining and machine learning computer vision robotics AI in bioinformatics AI in security and networks and other AI applications *Analysis, Architectures and Modelling of Embedded Systems* Achim Rettberg, Mauro C. Zanella, Michael Amann, Michael Keckeisen, Franz J. Rammig, 2009-09-19 This book presents the technical program of the International Embedded Systems Symposium IESS 2009 Timely topics techniques and trends in embedded system design are covered by the chapters in this volume including modelling simulation verification test scheduling platforms and processors Particular emphasis is paid to

automotive systems and wireless sensor networks Sets of actual case studies in the area of embedded system design are also included Over recent years embedded systems have gained an enormous amount of processing power and functionality and now enter numerous application areas due to the fact that many of the formerly external components can now be integrated into a single System on Chip This tendency has resulted in a dramatic reduction in the size and cost of embedded systems As a unique technology the design of embedded systems is an essential element of many innovations Embedded systems meet their performance goals including real time constraints through a combination of special purpose hardware and software components tailored to the system requirements Both the development of new features and the reuse of existing intellectual property components are essential to keeping up with ever more demanding customer requirements Furthermore design complexities are steadily growing with an increasing number of components that have to cooperate properly Embedded system designers have to cope with multiple goals and constraints simultaneously including timing power reliability dependability maintenance packaging and last but not least price
