Data Clustering in C++ Guojun Gan,2011-03-28 Data clustering is a highly interdisciplinary field the goal of which is to divide a set of objects into homogeneous groups such that objects in the same group are similar and objects in different groups are quite distinct Thousands of theoretical papers and a number of books on data clustering have been published over the past 50 years However few books exist to teach people how to implement data clustering algorithms This book was written for anyone who wants to implement or improve their data clustering algorithms Using object oriented design and programming techniques Data Clustering in C exploits the commonalities of all data clustering algorithms to create a flexible set of reusable classes that simplifies the implementation of any data clustering algorithm Readers can follow the development of

the base data clustering classes and several popular data clustering algorithms. Additional topics such as data pre processing, data visualization, cluster visualization and cluster interpretation are briefly covered. This book is divided into three parts: Data Clustering and C Preliminaries, A review of basic concepts of data clustering, the unified modeling language, object oriented programming in C and design patterns, A C Data Clustering Framework, The development of data clustering base classes, Data Clustering Algorithms, The implementation of several popular data clustering algorithms. A key to learning a clustering algorithm is to implement and experiment the clustering algorithm. Complete listings of classes, examples, unit test cases and GNU configuration files are included in the appendices of this book as well as in the downloadable resources. The only requirements to compile the code are a modern C compiler and the Boost C libraries.

Decomposition Methodology for Knowledge Discovery and Data Mining Oded Z. Maimon, Lior Rokach, 2005. Data Mining is the science and technology of exploring data in order to discover previously unknown patterns. It is a part of the overall process of Knowledge Discovery in Databases (KDD). The accessibility and abundance of information today makes data mining a matter of considerable importance and necessity. This book provides an introduction to the field with an emphasis on advanced decomposition methods in general data mining tasks and for classification tasks in particular. The book presents a complete methodology for decomposing classification problems into smaller and more manageable sub problems that are solvable by using existing tools. The various elements are then joined together to solve the initial problem. The benefits of decomposition methodology in data mining include increased

performance classification accuracy conceptual simplification of the problem enhanced feasibility for huge databases clearer and more comprehensible results reduced runtime by solving smaller problems and by using parallel distributed computation and the opportunity of using different techniques for individual sub problems
