Fandel,T. Gal,2012-12-06 He consider a cone dominance problem given a preference cone LP and a set $n \times R$ of available or feasible alternatives the problem is to identify the non dominated elements of X The nonzero elements of LP are assumed to model the dominance structure of the problem so that $y \in X$ dominates $x \in X$ if $Y \times P$ for some nonzero $p \in S$ LP Consequently $x \in X$ is nondominated if and only if $x \in LP \cap X \times 1$ He will also refer to nondominated points as efficient points in X with respect to LP and we will let $EF(X,P)$ denote the set of such efficient points This cone dominance problem draws its roots from two separate but related origins The first of these is multi attribute decision making in which the elements of the set X are endowed with various attributes each to be maximized or minimized
