Market Power Fouad Sabry, 2024-01-22 What is Market Power In economics market power refers to the ability of a firm to influence the price at which it sells a product or service by manipulating either the supply or demand of the product or service to increase economic profit In other words market power occurs if a firm does not face a perfectly elastic demand curve and can set its price P above marginal cost MC without losing revenue This indicates that the magnitude of market

power is associated with the gap between P and MC at a firm's profit maximising level of output. The size of the gap which encapsulates the firm's level of market dominance is determined by the residual demand curve's form. A steeper reverse demand indicates higher earnings and more dominance in the market. Such propensities contradict perfectly competitive markets where market participants have no market power ($P = MC$) and firms earn zero economic profit. Market participants in perfectly competitive markets are consequently referred to as price takers, whereas market participants that exhibit market power are referred to as price makers or price setters.
