Introduction to Google Translate Gilad James, PhD, Google Translate is a multilingual translation service provided by Google. It allows users to translate words, phrases, and entire documents between multiple languages. The service was launched in April 2006 and has since been constantly updated to provide more accurate translations. Initially offering translations in only two languages, Google Translate now supports over 100 languages. The translation process works by analyzing the text or document input by the user, breaking it up into smaller segments, and then using statistical algorithms to match these segments with translations from its database. Google Translate has been a helpful tool for people to communicate across different languages, whether it be for business or personal use. However, it must be noted that automated translations often carry a high risk of inaccuracies due to the complexities inherent in language and the nuances of different cultures and contexts. It is always recommended to use translations as a starting point and then have a native speaker review and refine the language to ensure accuracy.

Analysing English-Arabic Machine Translation Zakaria Almahasees, 2021-11-29. Machine Translation (MT) has become widely used throughout the world as a medium of communication between those who live in different countries and speak different languages. However, translation between distant languages constitutes a challenge for machines. Therefore, translation evaluation is poised to play a significant role in the process of designing and developing effective MT systems. This book evaluates three prominent MT systems including Google Translate, Microsoft Translator, and Sakhr, each of which provides translation between English and Arabic. In the book, Almahasees scrutinizes the capacity of the three systems in dealing with translation between English and Arabic in a large corpus taken from various domains including the United Nations, the World Health Organization (WHO), the Arab League, Petra News Agency reports, and two literary texts: *The Old Man and the Sea* and *The Prophet*. The evaluation covers holistic analysis to assess the output of the three systems in terms of Translation Automation User Society (TAUS) adequacy and fluency scales. The text also looks at error analysis to evaluate the systems' output in terms of orthography, lexis, grammar, and semantics at the entire text level and in terms of lexis, grammar, and semantics at the collocation level. The research findings contained within this volume provide important feedback about the capabilities of the three MT systems with respect to English-Arabic translation and pave the way for further research on such an important topic. This book will be of interest to scholars and students of translation studies and translation technology.

Assessing the Accuracy of Google Translate to Allow Data Extraction from Trials Published in Non-English Languages U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-03-21 One of the strengths of systematic reviews is that they aim to include all relevant evidence However study eligibility is often restricted to the English language for practical reasons Google Translate a free Web based resource for translation has recently become available However it is unclear whether its translation accuracy is sufficient for systematic reviews An earlier pilot study provided some evidence that data extraction from translated articles may be adequate but varies by language To address several limitations of the pilot study four

collaborating Evidence based Practice Centers conducted a more rigorous analysis of translations of articles from five languages Systematic reviews conducted by the Agency for Healthcare Research and Quality AHRQ Evidence based Practice Centers EPCs most commonly restrict literature searches to English language publications In a sample of 10 recent Evidence Reports numbers 189 198 8 were restricted to English language publications One report included studies in languages for which the EPC had available fluency and only one reported not restricting by language Among 28 other recent Comparative Effectiveness Reviews CERs with final or draft documents downloadable from the AHRQ Web site 20 were restricted to English language publications Four explicitly did not impose any language restriction Two did not report language restriction in their methods chapter and included one study each in Dutch and German One placed no language restriction on comparative studies but included only English language cohort studies One included German and French language studies for nonoperative interventions which were sparse but only English language publications for operative treatments due to lack of translation resources Three of the CERs wrote that the language restriction was due to lack of resources or prohibitive translation costs despite the recognition in one CER that requiring studies to be published in English could lead to bias The current study was designed to form a collaboration of EPCs to better analyze the accuracy of the freely available online translation tool Google Translate for the purposes of data extraction of articles in selected non English languages The collaboration allowed for double data extraction and a better consensus determination of the important extraction items to assess we also implemented an improved analytic technique The research had the following aims 1 Compare data extraction of trials done on original language articles by native speakers with data extraction done on articles translated to English by Google Translate 2 Track and enumerate the time and resources used for article translation and the extra time and resources required for data extraction related to use of translated articles
