The Initiation of Sound Change Maria-Josep Solé, Daniel Recasens, 2012-07-18 The origins of sound change is one of the oldest and most challenging questions in the study of language The goal of this volume is to examine current approaches to sound change from a variety of theoretical and methodological perspectives including articulatory variation and modeling speech perception mechanisms and neurobiological processes geographical and social variation and diachronic phonology This diversity of perspectives contributes to a fruitful cross fertilization across disciplines and represents an attempt to formulate converging ideas on the factors that lead to sound change This book is addressed to scholars in historical linguistics linguistic typology and phonology as well as to researchers in speech production and perception cognition and modeling Given the theoretical and methodological interest of the contributions as well as the novel instrumental techniques applied to the study of sound change this volume will interest professionals teaching language typology laboratory phonology sound change phonetics and phonological theory at the graduate level

Sound structure and sound change Rebecca Morley, 2019 Research in linguistics as in most other scientific domains is usually approached in a modular way narrowing the domain of inquiry in order to allow for increased depth of study This is necessary and productive for a topic as wide ranging and complex as human language However precisely because language is a complex system tied to perception learning memory and social organization the assumption of modularity can also be an obstacle to understanding language at a deeper level This book examines the consequences of enforcing non modularity along two dimensions the temporal and the cognitive Along the temporal dimension synchronic and diachronic domains are linked by the requirement that sound changes must lead to viable stable language states Along the cognitive dimension sound change and variation are linked to speech perception and production by requiring non trivial transformations between acoustic and articulatory representations The methodological focus of this work is on computational modeling By formalising and implementing theoretical accounts modeling can expose theoretical gaps and covert assumptions To do so it is necessary to formally assess the functional equivalence of specific implementational choices as well as their mapping to theoretical structures This book applies this analytic approach to a series of implemented models of sound change As theoretical inconsistencies are discovered possible solutions are proposed incrementally constructing a set of sufficient properties for a working model Because internal theoretical consistency is enforced this model corresponds to an explanatorily adequate theory And because explicit links between modules are required this is a theory not only of sound change but of many aspects of phonological competence The book highlights two aspects of modeling work that receive relatively little attention the

formal mapping from model to theory and the scalability of demonstration models Focusing on these aspects of modeling makes it clear that any theory of sound change in the specific is impossible without a more general theory of language of the relationship between perception and production the relationship between phonetics and phonology the learning of linguistic units and the nature of underlying representations Theories of sound change that do not explicitly address these aspects of language are making tacit untested assumptions about their properties Addressing so many aspects of language may seem to complicate the linguist s task However as this book shows it actually helps impose boundary conditions of ecological validity that reduce the theoretical search space
